

1 Subj: IPP Bake Off 3 Issues
2 From: Peter Zehler, [Tom Hastings](#)
3 File: Issues-raised-at-Bake-Off3-[010302001201](#).doc
4 Version: 1.10
5 Date: [3/2/2001](#)~~12/1/2000~~

6
7 This version incorporates the discussion on the mailing list resolving the IPP/1.1 issues raised at Bake Off
8 3. [Issue 3.2 about empty HTTP Post to force a challenge has been closed and the issue about when a](#)
9 [Printer MUST/MAY challenge has been made Issue 3.9.](#)

10 Please feel free to add additional alternatives or disagree with our suggested clarifications or additions via
11 e-mail so that the group may have the widest possible set of alternatives from which to choose.

12 ~~Status of Issues and Summary~~

13 The table of contents lists each issue and its status. This section lists the status of each issue and a brief
14 summary. The next section is the detailed description of the issue and the resolution or alternatives, if the
15 issue is still OPEN. Please review this status and the detailed issues to see if you agree or disagree with the
16 status so far. Silence will be interpreted as agreement.

17 Status codes:

18 **AGREED** - agreement on the mailing list or telecons on the suggested clarification, suggested change,
19 or resolution. Subsequence silence on the DL will be interpreted as agreement. If you disagree, please
20 indicate this to the ipp@pwg.org DL with the subject line containing: "IPP Bake-Off 3 Issue #" where
21 '#' is the Issue number.

22 **OPEN** - still being discussed at future telecons and on the DL.

23 OPEN issues remaining: 2 and 4.

24 Table of Contents (with status)

25	1. Issue 3.1: When can Printer send "100 continue"? AGREED.....	2
26	2. Issue 3.2: Does a zero length HTTP Post force the Printer to challenge? AGREED	2
27	3. Issue 3.3: Do supported schemes include the ':' character? - AGREED	3
28	4. Issue 3.4: Get-Printer-Attributes response to unsupported attributes - AGREED.....	4
29	5. Issue 3.5: Does 'mailto:' URL include '//'? - AGREED	4
30	6. Issue 3.6: Does 'none' "printer-state-reasons" value have suffixes? - AGREED	5
31	7. Issue 3.7: What is "notify-status-code" attribute syntax? - AGREED.....	6
32	8. Issue 3.8: Returning Subscription Attribute Groups - AGREED	6
33	9. Issue 3.9: When MUST/MAY a Printer issue a challenge? - OPEN	6

34

35 **1. Issue 3.1: When can Printer send “100 continue”? AGREED**

36 IPP Client failed when an unexpected HTTP “100 continue” was received. Some printers sent a “100
37 continue” even before the Client sent a request.

38 **Proposed Resolution:**

39 An IPP Client must accept and handle an HTTP “100 continue” whenever it is encountered.

40 **Action:**

41 The following caveat will be added to the IIG:

42 ‘IPP Clients must be prepared at any time to receive an interim response with a status code of ‘100
43 Continue’ This includes receiving this response prior to sending an IPP request.’

44 **2. Issue 3.2: Does a zero length HTTP Post force the Printer to** 45 **challenge? OPENAGREED**

46 Some IPP Clients issues a zero length HTTP Post. The Client assumed that this would force a
47 challenge if security is enabled on the Printer. The Client would have a problem if a subsequent print
48 operation were challenged.

49 **Proposed Resolution:**

50 The IPP Client MUST NOT send a zero length HTTP Post as a way to force the Printer to issue a
51 challenge. It is not clear from the HTTP standard whether or not the HTTP server must issue a
52 challenge. Some of the implementations at Bake Off3 did not issue a challenge to the zero length HTTP
53 Post.

54 **Action:**

55 The following caveat will be added to the IIG:

56 The client must not send a zero length HTTP Post as a way to force the Printer to issue a challenge.

57 **Proposed Resolutions:**

58 ~~There are two competing resolutions.~~

59 ~~Resolution 1 is that a challenge should be issued whenever an HTTP operation is received on a~~
60 ~~particular URL. (assuming the URL is part of an authentication space) The client must accept and~~
61 ~~respond to a challenge the first time a URL is accessed.~~

62 ~~Resolution 2 allows the vendor to determine when a challenge is issued. The vendor is free to use the~~
63 ~~contents of the HTTP request to determine if the operation mandates a challenge. The client must~~
64 ~~accept and respond to a challenge at any time.~~

65 ~~The Client should use the IPP operation “validate job” to check if a job will be accepted. This~~
66 ~~operation will cause the Printer to issue a challenge and check the print request before sending the data.~~
67 ~~The IPP Client should also be able to handle a challenge when issuing an IPP operation since there is no~~
68 ~~guarantee the connection has not been torn down.~~

69 ~~Furthermore, a Printer should accept an empty HTTP post and issue a challenge based on the URL of~~
70 ~~the post.~~

71

72 **Resolution 1:**

73 ~~From Bob Herriot:~~

74 I raised the issue about whether a Printer should perform the authentication
 75 challenge based solely on the URL or whether it could react differently to
 76 an empty request than to a Validate Job request.

77
 78 I asked an HTTP expert and received the following information.

79
 80 1) An HTTP server can have any policy.

81 ~~This means that resolution 2 is allowable.~~

82 2) It is best for a client if it can associate the URL tree with the authentication space.

83 ~~This means that our decision could be better. That is, we should require an IPP Printer to
 84 decide whether to issue an authentication challenge by examining the URL and nothing else, e.g.
 85 a Printer receiving a request for a particular URL, gives the same challenge to an empty request
 86 as to a Validate Job request.~~

87 ~~This solution allows a client to use Validate Job to request a challenge as we decided to allow.
 88 It also allows a client to use the empty request.~~

89 ~~The important difference between our decision and what I am proposing is that the Printer must
 90 perform an authentication challenge consistently for a URL regardless of the contents of the
 91 message body. This rule make IPP behavior consistent with good HTTP policy.~~

92

93 Resolution 2:

94 ~~From Peter Zehler:~~

95 ~~Allowing IPP Printers to use the contents of an IPP request to determine if a challenge should be issued
 96 allows for increased usability. The client does not have to keep track of multiple instances of the same
 97 printer and select the appropriate one based on the operation to be performed. The printer is free to
 98 determine when authentication is required. This allows the client to use a single URL and authenticate
 99 himself when the printer places restrictions on operations or features.~~

100 ~~This resolution does not prohibit challenges based statically on a URL. Resolution 2 does require a
 101 client to be ready at any time to receive a challenge. This should be done anyway since the client
 102 application may be unaware that an HTTP connection has dropped after authenticating the connection,
 103 resulting in a new challenge. Some HTTP servers have security realms that apply only to a transaction
 104 as well as being connection based.~~

105 **3. Issue 3.3: Do supported schemes include the ':' character? - AGREED**

106 Do the values for "notify-uri-schemes-supported" include the ':' character?

107 **Proposed Resolution:**

108 No. See rfc2911 section 4.1.6 uri scheme data type variables

109 **Action:**

110 Added the following ~~text note~~ to the ~~ipp-not~~IPP Notification specification ~~<draft-ietf-ipp-not-spec-~~
 111 ~~06.txt>~~, dated January 24, 2001, section 5.3.1 "notify-recipient-uri":
 112 ~~"The "notify-schemes-supported (1setOf uriScheme)" attribute MUST specify the schemes supported~~
 113 ~~for this attribute.~~ Note: According to [RFC1738] the ":" terminates the scheme and so is not part of the
 114 scheme. Therefore, values of ~~this~~ ~~the~~ "notify-schemes-supported" attribute do not include the ":".

115 **4. Issue 3.4: Get-Printer-Attributes response to unsupported attributes -**
 116 **AGREED**

117 For get-printer-attributes operation submitted with an unsupported "requested-attributes" value what is the
 118 return code and should an unsupported attributes group be returned containing the requested-attributes
 119 attribute and the unsupported value. There are four possibilities of status code and unsupported attribute:

- 120 A) successful-ok/no attributes
 121 B) successful-ok/unsupported requested-attributes returned
 122 C) Successful-attribute-or-value-ignored/ no attributes
 123 D) Successful-attribute-or-value-ignored/ unsupported requested-attributes returned

124 The standard currently allows C and D. Should the standard be relaxed to include C. The
 125 implementations at the Bake-Off supported were A-11, B-1, C-3, D-0

126 **Proposed Resolution:**

127 ~~Recommend D, allow C and warn client implementers about A.~~ Put all 4 alternatives in IIG and
 128 indicate:

- 129 A) warning to client implementers
 130 B) Printer MUST NOT
 131 C) Printer MAY
 132 D) Printer SHOULD.

133
 134 **Action:**

135 IIG will be updated with:

136 "Under Get-Printer-Attributes, For the following success status codes, the requested attributes are
 137 returned in Group 3 in the response:

138 successful-ok: no operation attributes or values were substituted or ignored (same as Print-Job)and
 139 no requested attributes were unsupported.

140 *Note to client implementers: If the client requests attributes that are not supported by*
 141 *the Printer, the Printer is supposed to return 'successful-ok-ignored-or-substituted-*
 142 *attributes', rather than 'successful-ok'. However, a number of implementations have been*
 143 *found not to conform to this requirement, so clients should be tolerant of such Printers.*

144 successful-ok-ignored-or-substituted-attributes: The "requested-attributes" operation attribute
 145 SHOULD be returned with the unsupported values in the Unsupported Attributes Group.

146 *Note to client implementers: Although NOT RECOMMENDED, the Unsupported*
 147 *Attribute Group and its contents MAY be omitted. Clients SHOULD be prepared for this*
 148 *behavior.*

149

150 **5. Issue 3.5: Does 'mailto:' URL include '//'? - AGREED**

151 In the subscription object is the does the mailto URL contain '//'. Is it <mailto://mumble> or
 152 <mailto:mumble> ?

153 **Proposed resolution:**

154 The mailto URL does not include '//'.
 155

Action:

156 The mailto notify document will be updated with a caveat when the RFC editor asks for typos. Here is
157 the complete updated text:

158

159 **5.2.1 notify-recipient-uri (uri)**

160 This section describes the syntax of the value of this attribute for the 'mailto' Delivery Method. The syntax
161 for values of this attribute for other Delivery Method is defined in other Delivery Method Documents.

162 In order to support the 'mailto' Delivery Method, the Printer MUST support the following syntax for the
163 'mailto' Delivery Method when the Printer uses SMTP. The line below use RFC 822 syntax rules and
164 terms.

165 "mailto:" mailbox

166 Note: the above syntax allows 1 occurrence of 'mailbox'. The occurrence of 'mailbox' represents an email
167 address of a Notification Recipient.

168 For SMTP, the phrase 'address part' of the "notify-recipient-uri" attribute value refers to the 'mailbox'
169 part of the value. Example:

170 mailto:jones@acme.com

171 Unlike other URLs, the mailto scheme MUST NOT use // after the colon (see [RFC2368]).

172 The Printer MAY support other syntax for the 'address part' if it supports email protocols in addition to
173 SMTP.

174 **6. Issue 3.6: Does 'none' "printer-state-reasons" value have suffixes? -** 175 **AGREED**

176 Are there suffixes to "printer-state-reasons" value "none" (i.e. none-error & none-report)?

177 **Proposed Resolution:**

178 Recommend that no suffixes be used for the value "none".

179 **Action:**

180 Add the following text to the IIG.

181 "Is a suffix needed for the "printer-state-reasons" 'none' value (Issue 3.6)?

182 The values of the "printer-state-reasons" MAY have suffixes of '-report', '-warning', and '-
183 error'. If none of these suffixes is included, the meaning is the same as 'error', i.e., the Printer is
184 stopped. However, for the 'none' value it is RECOMMENDED that no suffix be included,
185 even though the Printer is not stopped. However, some implementations do include the '-report'
186 suffix, i.e., return 'none-report'. There is no semantic difference between the "printer-state-
187 reasons" of 'none', 'none-report', and 'none-error'. They all mean that no additional
188 information on the printer's state is available. "

189 7. Issue 3.7: What is “notify-status-code” attribute syntax? - AGREED

190 What is the attribute syntax for the “notify-status-code” attribute?

191 Proposed Resolution:

192 It should be a type2 enum (which is a 32-bit integer, but the values are constrained to 16 significant bits
193 with the 16 high order bits always being zero, so that status codes values can be used here).

194 Action:

195 Added the following text to the IPP Notification specification [<draft-ietf-ipp-not-spec-06.txt>](#), dated
196 [January 24, 2001](#) in section 11.1.1.2:

197

198 “notify-status-code” (type2 enum):

199 Indicates the status of this subscription (see section 17 for the status code definitions). Section 5.2
200 defines when this attribute MUST be present in this group.

201 8. Issue 3.8: Returning Subscription Attribute Groups - AGREED

202 When MUST Subscription Attributes groups be returned in Subscription Creation responses and when
203 MUST the they not be returned? The current spec is too constraining on when they MUST NOT be
204 returned.

205 Proposed Resolution:

206 Require them to be returned unless the entire request cannot be interpreted.

207 Action:

208 ~~Add~~The following text ~~was changed to~~ the IPP Notification specification [<draft-ietf-ipp-not-spec-](#)
209 [06.txt>](#), dated [January 24, 2001](#) in section 11.1.1.2 ~~from~~:

210

211 Group 3-N: Subscription Attributes

212 These groups MUST be returned if and only if the “status-code” parameter returned in Group
213 1 has the values: ‘successful-ok’, ‘successful-ok-ignored-subscriptions’, or ‘client-error-
214 ignored-all-subscriptions’.

215 ~~to~~:

216 Group 3-N: Subscription Attributes

217 These groups MUST be returned unless the Printer is unable to interpret the entire request, e.g.,
218 the “status-code” parameter returned in Group 1 has the value: ‘client-error-bad-request’.

219 9. Issue 3.9: When MUST/MAY a Printer issue a challenge? - OPEN

220 When MUST a Printer issue a challenge? When MAY a Printer issue a challenge?

221 Proposed Resolutions:

222 There are two competing resolutions.

223 Resolution 1 is that a challenge should be issued whenever an HTTP operation is received on a
224 particular URL. (assuming the URL is part of an authentication space) The client must accept and
225 respond to a challenge the first time a URL is accessed.

226 Resolution 2 allows the vendor to determine when a challenge is issued. The vendor is free to use the
227 contents of the HTTP request to determine if the operation mandates a challenge. The client must
228 accept and respond to a challenge at any time.

229 The Client should use the IPP operation “validate-job” to check if a job will be accepted. This
230 operation will cause the Printer to issue a challenge and check the print request before sending the data.
231 The IPP Client should also be able to handle a challenge when issuing an IPP operation since there is no
232 guarantee the connection has not been torn down.

233 Furthermore, a Printer should accept an empty HTTP post and issue a challenge based on the URL of
234 the post.

235

236 **Proposed Resolution 1:**

237 From Bob Herriot:

238 I raised the issue about whether a Printer should perform the authentication
239 challenge based solely on the URL or whether it could react differently to
240 an empty request than to a Validate-Job request.

241

242 I asked an HTTP expert and received the following information.

243

244 1) An HTTP server can have any policy.

245 This means that resolution 2 is allowable.

246 2) It is best for a client if it can associate the URL tree with the authentication space.

247 This means that our decision could be better. That is, we should require an IPP Printer to
248 decide whether to issue an authentication challenge by examining the URL and nothing else, e.g.
249 a Printer receiving a request for a particular URL, gives the same challenge to an empty request
250 as to a Validate-Job request.

251 This solution allows a client to use Validate-Job to request a challenge as we decided to allow.

252 It also allows a client to use the empty request.

253 The important difference between our decision and what I am proposing is that the Printer must
254 perform an authentication challenge consistently for a URL regardless of the contents of the
255 message body. This rule make IPP behavior consistent with good HTTP policy.

256

257 **Proposed Resolution 2:**

258 From Peter Zehler:

259 Allowing IPP Printers to use the contents of an IPP request to determine if a challenge should be issued
260 allows for increased usability. The client does not have to keep track of multiple instances of the same
261 printer and select the appropriate one based on the operation to be performed. The printer is free to
262 determine when authentication is required. This allows the client to use a single URL and authenticate
263 himself when the printer places restrictions on operations or features.

264 This resolution does not prohibit challenges based statically on a URL. Resolution 2 does require a
265 client to be ready at any time to receive a challenge. This should be done anyway since the client

266 application may be unaware that an HTTP connection has dropped after authenticating the connection,
267 resulting in a new challenge. Some HTTP servers have security realms that apply only to a transaction
268 as well as being connection based.
269
