17 LDPA - Lightweight Document Printing Application
18 Version 0.8, October 31, 1996

19 Status of this Memo

20
21 This document is a working version of a protocol specification. It
22 will eventually become an Internet-Draft by following well defined
23 IETF procedures. At that time, the following paragraphs must be
24 included:

25
26 This document is an Internet-Draft. Internet-Drafts are working
27 documents of the Internet Engineering Task Force (IETF), its areas,
28 and its working groups. Note that other groups may also distribute
29 working documents as Internet-Drafts.

30
31 Internet-Drafts are draft documents valid for a maximum of six months
32 and may be updated, replaced, or obsoleted by other documents at any
33 time. It is inappropriate to use Internet-Drafts as reference
34 material or to cite them other than as ``work in progress.''

35
36 To learn the current status of any Internet-Draft, please check the
37 ```lid-abstracts.txt'' listing contained in the Internet-Drafts Shadow
38 Directories on ftp.is.co.za (Africa), nic.nordu.net (Europe),
39 munnari.oz.au (Pacific Rim), ds.internic.net (US East Coast), or
40 ftp.isi.edu (US West Coast).

41 Abstract

42
43 This Internet-Draft specifies a Lightweight Document Printing
44 Application (LDPA) protocol for the Internet. This protocol is a
45 subset of the semantic operations and attributes defined in ISO/IEC
46 10175 Document Printing Application (DPA) parts 1 and 3. It also
47 incorporates some of the implementation and interoperability lessons
48 learned from other printing related standards such as POSIX System
49 Administration - Part 4 (POSIX 1378.4) and X/Open A Printing System
50 Interoperability Specification(PSIS).

51
52 LDPA is defined as a set of abstract data types and operations. The
53 operations are implemented using the Internet standard remote
54 procedure call mechanisms defined in RFC 1831 (RPC: Remote Procedure
55 Call Specification Version 2).

56
57 The LDPA protocol covers only user operations on basic print service

60 objects. Authentication, Access Control, Device Management, and
61 Service Management are all outside the scope of this protocol. These
62 areas are covered by other protocols include methods and operations
63 for service creation, management, and administration. The SNMP
64 Printer MIB [1] is an example of one of these. In the areas where
65 there are no existing standards, many are being worked in other
66 distributed service forums (management, security, etc.). As these
67 services become more standardized, this document (and hence the
68 protocol) can be updated to reflect the integration and relationships
69 with these other standards.

185 1. Introduction
186

187 This document is a Proposed Internet-Draft. It is a specification for
188 a protocol that can be used for distributed printing on the Internet.
189 This protocol, Lightweight Document Printing Application (LDPA), is
190 based on the printing model introduced in the Document Printing
191 Application (ISO/IEC 10175 DPA) standard. The DPA model describes a
192 distributed printing service made up of cooperating networked
193 entities. DPA also identifies user and administrative roles and
194 operations. These ideas and concepts, when unified with other
195 Internet protocols and services, realizes a distributed print service
196 for the Internet.

197
198 This specification obsoletes RFC 1179 "Line Printer Daemon Protocol"
199 [10]. "lpr" was designed a long time ago with line printers in mind.
200 It does not fit with current page oriented printing technologies and
201 most printer vendors have made their own proprietary extensions to
202 "lpr" to try and get by with current needs. Unfortunately, these
203 extensions are mutually incompatible, which means that many enhanced
204 "lpr" implementations cannot interwork. In the X/Open PSIS project
205 [6], these differences were documented and appropriate gateway
206 solutions between DPA and each vendor (Digital, HP, IBM, SCO, Sun,
207 and Xerox) described. LDPA introduces several improvements over RFC
208 1179:

- 209 - It uses Object Identifiers (OIDs) for interoperability and
210 extensibility.
- 211 - It models the more complex, multiple content object page oriented
212 languages and printers.
- 213 - It is based on a well known and well tested ISO standard.
- 214 - It supports desktop printing models as well as current market
215 trends for distributed systems which are as diverse as they are
216 spread throughout the globe.

217
218 This document assumes a distributed computing environment where print
219 service users (clients, applications, drivers, etc.) cooperate and
220 interact with print service providers (servers, printers, gateways,
221 etc.) to realize the print service.

222
223 The actual protocol consists of abstract data types representing the
224 distributed print service and its components as well as operations
225 which define and give semantics to the interaction between these
226 components. The operations defined for this protocol are defined as
227 RFC 1831 [2] compliant remote procedure calls. These operations are
228 defined in sections 4, 5, and 6. The objects and their attributes
229 are defined in section 7.

230
231 NOTE: The abstract data types could be defined using a syntax such as
232 RPC language [2] or ASN.1 [8]. The actual encoding of the abstract
233 data types could be realized using either XDR [3] or BER [9]. The
234 actual syntax and encoding mechanism must be finalized during the
235 standards process. Only the operations and attribute semantics are
236 defined at this time. This document does not yet contain the small
237 subset of syntax definitions for the proposed attributes. These can
238 be added as a short appendix to this document. For the operations,
239 this document currently shows operations defined in both ASN.1 and
240 XDR. The full ASN.1 for ISO/IEC 10175 parts 1 and 3 (attributes,
241 syntaxes, and operations) can be found at

242 "ftp://ftp.pwg.org/pub/pwg/snmpmib/dpa". A proposal for the XDR
243 version of the operation, attributes, and syntaxes can be found at
244 "ftp://ftp.pwg.org/pub/pwg/netprint/ldpa".
245
246

247 2. Distributed Printing 248

249 The distributed printing service is defined as a collection of
250 coordinating and cooperating entities in a distributed computing
251 environment. The model assumed by this protocol is a n-tier
252 client/server model. A service requester (client) makes service
253 requests of service providers (servers). A given instance of a
254 service provider (server) may in turn be a service requester (client)
255 of some other service via its service providers (servers).
256

257 A client is able to access the services offered by a server by
258 invoking one or more operations associated with the server. Each
259 operation has associated arguments and results. The arguments
260 provide additional data which is passed from the client to the
261 server. The results return the status and outcome of the desired
262 operation back to the client from the server.
263

264 2.1 Components 265

266 In the distributed printing service the entities or components are:
267

- 268 - One or more humans or agents acting on behalf of humans. Humans
269 (or their agents) act in the role of Users, Operators, Managers,
270 or Administrators.
271
- 272 - One or more clients. Client are computer network nodes with which
273 end users interact in order to manipulate the distributed print
274 service. A client implements the LDPA protocol.
275
- 276 - One or more print service providers. An instance of a print
277 service provider implements the LDPA protocol and performs and
278 responds to LDPA operations. A given instance of a print service
279 provider can be a "client" of yet another instance of a print
280 service provider. A print service provider can either be
281 physical or logical (physical if it represents a physical printer
282 or some other document production device, or logical if it
283 represents one or more print service providers each of which may
284 be logical or physical).
285

285 This LDPA specification only defines the operation used by Users.
286 The operations used by Operators, Managers, and Administrators are
287 not within the scope of this standard.
288

289 2.2 Objects 290

291 To accomplish the action(s) requested via an operation, the print
292 service provider manages and manipulates data objects. These are
293 simply convenient collections of data that may represent other
294 objects (real life or computer system) elsewhere. A client supplies
295 arguments in the form of attribute values for some of these objects.
296 A server informs the client of the status or outcome of an operation
297 by also providing attribute values for the objects involved in the
298 operations. These objects are not encapsulations of both data and

299 behavior as in other object oriented models, but are simple
300 collections of attribute/value pairs.
301

302 The objects which are relevant to this protocol are:
303

- 304 - Printer
- 305 - Job
- 306 - Document
- 307 - Initial Value Job
- 308 - Initial Value Document

309
310 LDPA defines the operations that interact with and affect the real-
311 life objects represented by the protocol's object definition.
312

313 2.2.1 Printer 314

315 One of the most significant components within the distributed
316 printing service is a Printer. A Printer is an instance of a print
317 service provider that provides access to both Logical and Physical
318 output devices. A Printer object is a composition of some of the
319 functionality that has traditionally been tied to other components
320 within the printing system. A Printer can support the functionality
321 of spooling, job management, device management, server, as well as
322 more traditional device components.
323

324 A Printer can be in one of two modes:
325

326 Public Access: The Printer is not restricted with any access
327 control checks. The Printer uses a simple, name only (no password
328 or credential) form of binding.
329

330 Controlled Access: The Printer may have some restrictions based on
331 some authentication and authorization scheme. The Printer uses
332 some form of credential based binding.
333

334 A Printer object represents an instance of a print service provider
335 which implements the LDPA protocol. This allows the Printer to
336 provide a common interface for all types of disparate and diverse
337 physical devices or as well as a gateway interface for other non-
338 Internet based printing systems.
339

340 To a print service user, a Printer has the "looks and feel" of a any
341 typical physical printer. Jobs are submitted to and managed at the
342 Printer. The Printer can accept or reject submitted jobs based on
343 job attributes which are sent along with the print job. The Printer
344 tracks all jobs that have been submitted to it. The Printer can be
345 modified to indicated a corresponding behavior change at the device
346 level (either manually or automatically). In the Controlled Access
347 mode, the Printer has an identity with a security or credential
348 service.
349

350 The Printer can be a service provider for any of the following
351 configurations:
352

- 353 - The Printer can be a Physical Printer which represents and
354 controls a print device using a device specific interface
355 (possibly embedded).

- 356 - The Printer can be a Gateway to some other printing system (for
 357 example LPD).
 358 - The Printer can be a Logical Printer which feeds other Printers
 359 (either Physical or Logical or Gateway).

360
 361 Figure 1 shows some of the typical configurations of Printers:

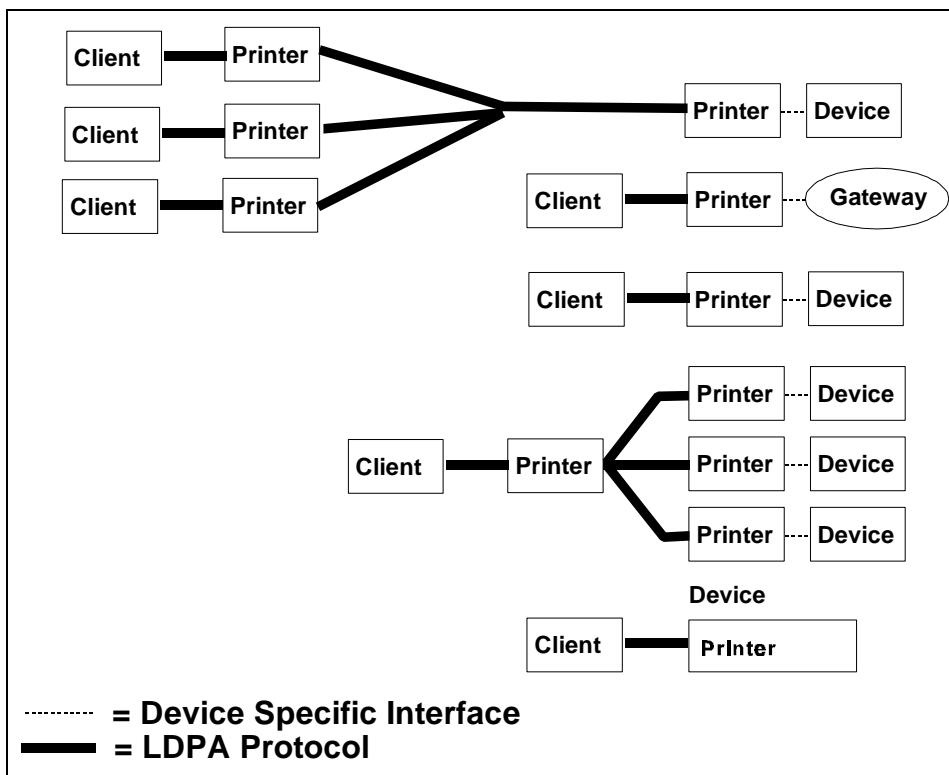

Figure 1 Printer Configurations

365 The following questions may arise:

- 366 1. How can I submit a job to a queue and have that job be routed to
 367 any available physical printer?

368 In the LDPA model, there are two kinds of Printers. One that
 369 directly drives a print device by using a device specific protocol.
 370 We call that Printer a Physical Printer. The second kind of Printer
 371 is one that communicates with other Printers using the LDPA protocol.
 372 The Physical Printer only implements the server side of the LDPA
 373 protocol. The Logical Printer implements both the client and the
 374 server side of the LDPA protocol.

- 375 2. How can I achieve both "fan out" and "fan in" of client to
 376 Printers and from Printers to physical print devices?

377 For "fan in", an administrator may set up one or more non-spooling
 378 Logical Printers that feed a given Printer. These Logical Printers
 379 are used to define different defaults, capabilities, and access

385 rights. For "fan out", an administrator may set up a Logical Printer
386 which can fan out to one or more downstream Printers for load
387 balancing and reliability.

388 3. How can a Printer be configured to service multiple spooling
389 Logical Printers?

390 The system administrator establishes which Logical and Physical
391 printers spool and which do not. If multiple spooling Logical
392 Printers are used to feed the same Printer, their schedulers are not
393 coordinated. Although this configuration is possible, it is not
394 recommended.

395 2.2.2 Job

396 A Job object is used to model a job. A job can consist of one or
397 more documents. There are certain job attributes that pertain to the
398 running and scheduling of the entire job (all documents). There are
399 other job attributes that define global behavior or defaults for all
400 contained jobs.

401 2.2.3 Document

402 A Document object is used to model a document. There are attributes
403 that describe the contents of the document as well as the processing
404 and handling of the document.

405 2.2.4 Initial Value Job

406 An Initial Value Job object is used to model job defaults. These are
407 essentially job attributes that are used as default attributes for
408 each job that is submitted.

409 2.2.5 Initial Value Document

410 An Initial Value Document is used to model document defaults. These
411 are essentially document attributes that are used as default
412 attributes for each document that is submitted as part of a job.

413 2.3 Object Relationships

414 Instances of objects within the system have relationships which must
415 be maintained persistently along with the persistent storage of the
416 objects themselves.

417 An instance of a print service provider is a Printer. The Printer is
418 represented via a Printer object. A Printer can contain zero, one,
419 or more Job objects. A Job object contains one or more Document
420 objects. The following relationships are examples:

- 421 • "Document object D1 belongs to Job object J1", or
- 422 • "Job object J1 belongs to Printer object P1".

423 2.4 Use of Naming and Directory Services

442 Any distributed service uses some sort of naming and/or directory
443 service for (X.500, NDS, DCE naming, DNS). It is outside the scope
444 of this protocol to define which name service to use or what the
445 protocol is for using that name service, but the following discussion
446 helps to clarify how the name service is intended to be used.
447

448 To distributed printing system, the instances of print service
449 providers are represented by objects of type Printer. These same
450 instances are also registered to the name/directory service. There
451 is one entry in the name service for each Printer.
452

453 That is, instances of print service providers are represented to LDPA
454 as Printer objects. These objects represent their real-life
455 counterparts, the print service provider (software, hardware, or
456 firmware). However, for directory lookup, there is an entry in the
457 naming service that also represents the Printer.
458

459 It is important to remember that a Printer object represents the
460 current status and configuration information of a certain print
461 service provider. The Printer object contains attributes and values
462 that describe the characteristics and capabilities of the logical or
463 physical print device. However, a few of the most important
464 attributes from the Printer object are duplicated in the entry in the
465 directory. These attributes are used for filtered directory lookups.
466 The results of these searches enable a user to select an appropriate
467 printer. It is the responsibility of the Printer itself to keep these
468 attributes consistent and accurate. This requirement frees the
469 directory or some directory agent from continually polling registered
470 entities for configuration changes.
471

472 The following attributes are in the directory entry:
473

474 Fully Distinguished Name (the name within the directory's
475 name space)
476 Description
477 Location
478 Owner
479 Address
480 Status
481 Resolution
482 Color Supported
483 Maximum Speed
484 Maximum Speed Units
485 Device Id
486 Model
487 Manufacturer
488 Type
489 PDLS Supported
490 Sides Supported
491

492 The final set of name service entry attributes needs to be finalized
493 and rationalized with the PSIS name service recommendations [6] as
494 well as implementation experience.
495

496
497 2.4.1 Status
498

499 The printer status field in the directory entry is really a "summary"
500 attribute of the true printer state. The following mapping takes
501 place between the Printer Status attribute in the directory entry and
502 the printer-state attribute in the Printer object:
503

504 "Not Connected"
505 STATE_NOT_CONNECTED
506 STATE_PAUSED_NOT_CONNECTED
507 "Shutdown"
508 STATE_SHUTDOWN
509 "Active"
510 STATE_IDLE
511 STATE_PAUSED
512 STATE_PRINTING
513 "Stopped"
514 STATE_STOPPED
515 STATE_PAUSED_STOPPED
516

517 Even though the Printer may not be up and running, the directory
518 entry still exists in the directory. In this case, the directory
519 entry represents the fact that it may begin running at some future
520 time.
521

522 2.4.2 Resolution

523 This is a single valued, maximum resolution in either the horizontal
524 or vertical direction of the print device in dpi.
525

526 2.4.4 Color Supported

527 This is a BOOLEAN for either yes, color printing is supported, or no
528 color printing is not supported.
529

530 2.4.5 Maximum Speed

531 This is the maximum speed of the printer in the units defined in
532 Maximum Speed Units
533

534 2.4.6 Maximum Speed Units

535 This is the units of the maximum speed rating of the print device.
536 This can be: pages per minute, sheets per minutes, characters per
537 second, etc.
538

539 2.4.7 Plug and Play Device Id

540 This attribute can be used for automatic driver download and other
541 automatic configuration tasks.
542

543 2.4.8 Model

544 This is a simple text string defined by the manufacturer.
545

546 2.4.9 Manufacturer

547 This is a simple text string defined by the manufacturer. There is
548 no registration, and there is a possibility of overlap, but the goal
549

556 is to keep this simple, not too complex.
557

558 2.4.10 Type

559
560 This is the printing mechanism of the print device: laser, ink jet,
561 thermal, etc.

562
563 2.4.11 PDLs Supported

564
565 This is a list of all of the page description languages (PDLs) that
566 the printer and/or its interpreter(s) support.

567
568 2.4.12 Sides Supported

569
570 This is either a 1 or a 2 to indicate the maximum number of sides on
571 which the printer can automatically print.

572
573 2.5 OIDs

574
575 This protocol makes use of Object Identifiers (OIDs). All OIDs used
576 in this protocol are defined encoded using the OBJECT IDENTIFIER
577 ASN.1 syntax and the BER encoding of OBJECT IDENTIFIER.

578
579 This specification does not introduce any new OIDs. The following
580 rules are used:

- 581
582 - Since LDPA is a small subset of DPA, for all attributes and values
583 which are OIDs and are defined as within the scope of this
584 specification, the OIDs from DPA will be used.
585 - For any extensions to this specification that fall within DPA
586 operations or semantics, OIDs from DPA will be used.
587 - For any vendor specific extensions, OIDs from the appropriate
588 enterprise arcs in the OID tree will be used.

589
590 3. Internet Printing Model

591
592 3.1 Object Instances

593
594 All instances of all objects have an identifier attribute that makes
595 them unique so that they can be unambiguously referenced. In the
596 object-oriented model, these are the globally unique object
597 references which are created by factories or constructors.

598
599 The following objects have the following mandatory identifier
600 attributes:

602 Object	603 Identifier	604 Containing Object
605 Printer	606 printer-name	607 None
608 Job	609 job-identifier	610 Printer
611 Document	612 document-sequence-number	613 Job
614 Initial Value	615 Job	616 Printer
617 Initial Value	618 TBD	619 Printer
	620 Document	

613 3.2 Limits and Defaults
614

615 This LDPA specification does not include any mechanism for specifying
616 for enforcing "limits" or any other kinds constraints. However,
617 defaults are achieved through the implementation of Initial Value Job
618 and Initial Value Document objects.

619
620 3.3 List Object Attribute Scoping Rules
621

622 The LIST-OBJECT-ATTRIBUTES operation is used for various reasons.
623 The first of which, is to list contained jobs under a given Printer.
624 Listing jobs works in this manner, according to the designator in the
625 LOA (LIST-OBJECT-ATTRIBUTES) request:

- 627 1. LIST_OP_ORDERED_JOBS
628 - Lists scheduled jobs. Does not include retained jobs.
- 630 2. List objects (job class) with specified instances. Includes
631 retained jobs.
- Lists specified jobs. If a job is not found as a current
633 job, LOA looks for it as a retained job.
- 635 3. List objects (job class) without specified instances. Includes
636 retained jobs; retained jobs are listed after current jobs.
- If the client is bound to a printer agent, lists all jobs for
638 that printer agent.
- If only retained jobs are desired, the retained job state may
640 be specified in a filter.

641
642 The second reason that the LIST-OBJECT-ATTRIBUTES operation is used
643 is to query the database to find out about contained object
644 relationships such as "What are the initial value objects for a given
645 Printer?". The rules for these types of operations are:

- 647 1. List objects without specified instances.
648 - Lists all contained objects

649
650 4. Operations
651

652 LDPA defines 7 operations:

- 655 - Bind
- Unbind
- Print
- Cancel Job
- List Object Attributes
- Modify Job
- Resubmit Job

663 4.1 Common Data Structures
664

665 This section describes the common data structures that are used by
666 two or more operations.

667
668 4.1.1 XDR
669

```
670      /*
671      // Note: Text is stored in XDR structures in Unicode, to eliminate
672      // problems in comparing disparate forms of text.
673      // Unicode characters are always kept in low-high byte order
674      // structures.
675      //
676      // The Text structure is defined as opaque, for efficiency
677      // in marshalling / unmarshalling operations.
678      // This means that the array item count contains the number
679      // of bytes, rather than the number of 16-bit characters.
680      */
681
682      typedef opaque Text<>;
683
684
685      /* ----- job identifier ----- */
686      struct PrtContainedObjectId {
687          Text          printerName;
688          uint32        localIdentifier;
689      };
690      typedef PrtContainedObjectId PrtContainedObjectIdSet<>;
691
692      /* ----- document identifier ----- */
693      struct DocumentIdentifier {
694          PrtContainedObjectId jobIdentifier;
695          uint32            documentNumber;
696      };
697
698
699      /*
700      // Often times it is necessary for an object to have an
701      // attribute whose value is the "identifier" of another object.
702      // These attributes used an attribute syntax as defined below
703      */
704
705      enum ObjectIdentificationEnum {
706          OBJ_ID_PRT_CONTAININD_OBJ_ID = 0,

5. Binding and Unbinding

There are two special operations that are defined for establishing a "session" between a client and a server. These are the BIND and the UNBIND operations.

5.1 Bind Operation

5.1.1 Bind Argument

The following abstract data types are part of the Bind Argument:

1011	Printer Name	The name instance of the Print Service Provider (Printer object) to which the bind is being done.
1012	Credentials	These can simple (name of the client performing the Bind) or the actual opaque Credential from some security/authorization service. All LDPA implementations must support at least the simple option.
1013 1014	Other Security Info	Optional additional opaque security information if needed for a given security/authorization service.

1015
1016 5.1.1.1 XDR

```

1017
1018     struct Creds {
1019         Text             name;
1020         opaque          password<>;
1021     };
1022
1023     struct Other1 {
1024         string          serverNamePtr<>;
1025         nuint16         connection;
1026     };
1027
1028     struct Othern {
1029         nuint16         othern;
1030     };
1031
1032     enum CredentialsEnum {

6.3.2 List Object Attributes Result

The following abstract data types are part of the List Object Attributes Result:

1531

Time	The operation can take an indeterminate amount of time to process. The results to a single Argument can be returned in multiple phases. This Result of for one of those phases. This processing time element is the time required for this phase of the opration.
Continuation Context	Optional opaque context information for performing another argument request on the next phase of the same operation.
Limit Encountered	Information on the type of limit that was encountered which forces the end of the operation even if there is a potential for more results. Values include TIME, COUNT, ERRORS.
Result Attributes	Attribute set containing the returned results.
Errors	Optional Error Information

1866 Initial Value Job Attributes
1867 Initial Value Document Attributes
1868
1869 In the following sections, most of the text has been taken word for
1870 word from ISO/IEC 10175 DPA (Final, June 1996).
1871
1872 7.1 Job Attributes
1873
1874 A job object contains a set of job attributes and one or more
1875 document objects. The server shall create a printable job object in
1876 response to a client that invokes one or more Print
1877 abstract-operations. In addition, initial-value-job objects are
1878 created in a server by means outside the scope of this part of
1879 ISO/IEC 10175 in order to represent complete sets of default values
1880 for job attributes (see the initial-value-job object class).
1881
1882 In addition to the attributes specifically defined for the job and
1883 initial-value-job objects, certain of the generic attributes may also

1884 be associated with these objects. For example, when requesting a
 1885 list of attribute values for an object of these classes, the client
 1886 may identify one or more of the generic attributes in the following
 1887 table, for which the server shall return values if the attributes are
 1888 implemented.

1890 There are no notification profiles included in this LDPA
 1891 specification.

1893 There is a table for each attribute that shows its: name, syntax,
 1894 multi or single valuedness (S or M), and any relevant notes.

1896 7.1.1 Job Informational Attributes

1898 These attributes provide information to identify a print-job.

1900 The client may specify job-information attributes in:

- 1901 a) Print: all, except id-att-job-identifier
- 1902 b) ModifyJob: all, except id-att-job-identifier, id-att-job-owner
- 1903 c) ListObjectAttributes: all

1905 7.1.1.1 job-identifier

1907 job-identifier	1908 jobIdentifierSyntax	S	
-------------------------------	------------------------------------	---	--

1909 This attribute provides the job-identifier for this job on the
 1910 server. The server shall generate a job-identifier value that is
 1911 unique on that server, but need not be unique across the distributed
 1912 environment.

1914 The value of the job-identifier attribute shall be returned by the
 1915 server as part of the PrintResult in the first Print
 1916 abstract-operation for the job. The client shall pass its value as
 1917 part of the argument in subsequent abstract-operations for the same
 1918 job.

1920 7.1.1.2 job-owner

1922 job-owner	1923 distinguishedNameStringSyn	S	
--------------------------	---	---	--

1924 Attribute value types that specify the name of an object, file, or
 1925 person as a string that can be either (1) a simple name by itself or
 1926 (2) a simple name qualified with a path name employ this generic data
 1927 type and syntax. If the path name is included, an optional
 1928 name-syntax element may be used to specify the syntax of the path
 1929 name, i.e., to identify the name syntax of the service being used.
 1930 If the name-syntax element is omitted, the server shall assume the
 1931 name-syntax is identified by some other means.

1933 The following standard values are defined for use in the name-syntax
 1934 element to identify the syntax of names:

1936 Descriptive Name	1937 Object Identifier	Descriptor Text
---------------------------------	----------------------------------	-----------------

1938	automatic	id-val-dn-syntax-automatic	server recognizes the syntax
1939			ISO/IEC 9594
1940	X-500	id-val-dn-syntax-x-500	Directory Service
1941			X/OPEN Federated
1942	XFN	id-val-dn-syntax-xfn	Names
1943			Distributed Computing
1944	DCE	id-val-dn-syntax-dce	Environment -
1945			includes X.500 and
1946			CDS
1947

1976			
1977			
1978	As with any NameOrOid, implementors may use their own object identifiers or simple names (if they have not assigned an OID) for implementation-defined name-syntaxes.		
1979			
1980			
1981			
1982	This attribute supplies the name of the human owner of the print-job.		
1983			
1984	The value of job-owner will often be the same as job-originator. The job-owner will be different from job-originator when the job has been submitted by the originator on behalf of the owner.		
1985			
1986			
1987			
1988	If this attribute is not specified, the value of user-name or job-originator should be used for any circumstances which require a value for job-owner.		
1989			
1990			
1991			
1992	7.1.1.3 TBD		
1993			
1994			

1995 7.1.1.4 job-name

1996	job-name	simpleNameSyntax	S	
------	----------	------------------	---	--

1997
 1998
 1999 This attribute supplies a human readable string for the print-job.
 2000 This string is used for naming the print-job in human-readable
 2001 "free-form" fashion.

2002
 2003 This attribute is intended for enabling a user or the user's
 2004 application to convey a job name that may be printed on a start
 2005 sheet, returned in a ListObjectAttributes result, or used in
 2006 notification or logging messages.

2007
 2008 If this attribute is not specified, no job name is assumed, but
 2009 implementation specific defaults are allowed, such as the value of
 2010 the document-name attribute of the first document in the job.

2011 7.1.2 Printer Selection Attributes

2012
 2013 These attributes provide information to help select a particular
 2014 printer. If more than one printer-selection attribute is specified,
 2015 the server shall select a printer that meets all of the criteria.

2016
 2017 The client may specify printer-selection attributes in:
 2018 a) Print: all, except the value of printer-name-requested (which
 2019 shall be passed as an explicit parameter of the first
 2020 PrintArgument, rather than as an attribute)
 2021 b) ModifyJob: all, except printer-name-requested
 2022 c) ListObjectAttributes: all

2023 7.1.2.1 printer-name-requested

2024	printer-name-requested	simpleNameSyntax	S	
------	------------------------	------------------	---	--

2025
 2026 This attribute identifies the printer to be used for printing the
 2027 job. The client shall specify the value of this attribute with the
 2028 first invocation of the Print abstract-operation for the print-job as
 2029 the explicit printer-name component of the PrintArgument, rather than
 2030 as an attribute.

2031
 2032 NOTES
 2033 1 To cause a server to select a printer according to other
 2034 attributes, the system administrator should define a logical printer
 2035 that supports the desired set of physical printers.
 2036 2 Initial-value-job objects should have the value of their
 2037 printer-name-requested attribute specified as an empty value in order
 2038 to indicate that no printer-name is defaulted.

2039 7.1.3 Job Status Attributes

2040
 2041 These attributes specify the job status before, during and after the
 2042 processing of the print-job by the server. The server shall create
 2043 the job object with these attributes (if implemented) and shall
 2044 assign appropriate values to each such job-status attribute.

2050

2051 The client may specify job-status attributes in:
 2052 a) Print: none
 2053 b) ModifyJob: none
 2054 c) ListObjectAttributes: all

2055

2056 7.1.3.1 current-job-state

2057

2058	current-job-state	objectIdentifierSyntax	S	
2059				

2060

2061 This attribute identifies the current state of the job (pending,
 2062 printing, held, etc.).

2063

2064 The following job state standard values are defined:
 2065 id-val-job-state-unknown, id-val-job-state-pre-processing,
 2066 id-val-job-state-held, id-val-job-state-pending,
 2067 id-val-job-state-processing, id-val-job-state-paused,
 2068 id-val-job-state-interrupted, id-val-job-state-terminating,
 2069 id-val-job-state-retained, id-val-job-state-completed

2070

2071 The LDPA protocol supports all values for job states, but printers
 2072 are not required to generate all job states, only those which are
 2073 appropriate for the particular implementation.

2074

2075 If a printer implementation or policy is to start processing
 2076 documents before the last print-request (with a TRUE value for the
 2077 job-submission-complete parameter), the printer may change the job's
 2078 current-job-state from pre-processing directly to the processing
 2079 state when the printer begins processing any of the job's documents.

2080

2081 7.1.3.2 printers-assigned

2082

2083	printers-assigned	simpleNameSeqSyntax	S	
2084				

2085

2086 This attribute identifies the physical printer or printers to which
 2087 this job has been assigned, if any.

2088

2089 When the job is first submitted and the printer has not yet assigned
 2090 any printers to the job, the SEQUENCE shall be empty.

2091

2092 If the printer intends to use a single printer for the job, and the
 2093 printer has assigned a printer to the job, the SEQUENCE shall contain
 2094 just that printer.

2095

2096 If a printer has split the job into multiple pieces and assigned each
 2097 piece to a different printer, the SEQUENCE shall contain n elements,
 2098 one for each assigned printer. A job with multiple job-result-sets is
 2099 an example of a job that would be easy to split into multiple pieces.

2100

2101 A SEQUENCE with no elements shall be returned if this attribute is
 2102 supported, but this job has not yet been assigned to any physical
 2103 printers.

2104

2105
2106 The number of elements in the SEQUENCE for this attribute shall be
2107 the same as the number of elements in the SEQUENCE for the associated
2108 job attribute printer-state-of-printers-assigned.

2109 In addition, the *i*th element of the value of
2110 printer-state-of-printers-assigned shall be the state of the printer
2111 named by the *i*th element of printers-assigned.

2112
2113 The printers-assigned value shall not be the same as the printer
2114 requested by the user if the job's printer-name-requested attribute
2115 specified a logical printer that supports one or more different
2116 physical printers. The printers-assigned value might differ also if
2117 the job has been re-assigned by an operator to ensure successful
2118 completion of the job, allowing the user to find out where a job has
2119 been re-assigned (when necessary).

2120
2121 The value of the job's printers-assigned attribute shall remain after
2122 the job has completed, so that users can determine the physical
2123 printer(s) on which the job was printed.

2124 7.1.3.3 submission-time

2127	submission-time	generalizedTimeSyntax	S	
------	-----------------	-----------------------	---	--

2128
2129 This attribute indicates the time at which the latest print request
2130 or this job was accepted by the printer. If the printer does not
2131 support the notion of time, the attribute is not stored as part of
2132 the job object.

2133 7.1.3.4 print-checkpoint

2136	print- 2137 checkpoint	printCheckpointSyntax	S	
------	-------------------------------	-----------------------	---	--

2138
2139 This attribute indicates the job-copies, document-copies, pages, and
2140 octets completed for the document or documents on the specified
2141 printer(s) and the local context information at which the last
2142 checkpoint was taken.

2143
2144 This attribute allows a print service to provide information about a
2145 checkpoint of a job that is printing. This would indicate where a
2146 print-server could resume printing of this job - at a page and copy
2147 number of a document close to the point at which the job was paused
2148 due to malfunction or operator request.

2149
2150 The context-info element shall contain information that would be
2151 needed by the server and printer to enable them to resume printing at
2152 the last checkpoint. The format of this element identified by the
2153 checkpoint-format element . The content of this element is
2154 implementation-specific; the intent is that the client would return
2155 this element, without alteration, in a ResumeJobArgument in order to
2156 resume the job.

2157
2158 NOTE - A server should encode the value of context-info in such a way
2159 as to protect against clients submitting ResumeJob requests with

2160 altered context-info.

2161
 2162 The checkpoint-format element shall identify the encoding format used
 2163 for the context-info element. Standard values are defined in the
 2164 printer attribute checkpoint-format-supported.

2165
 2166 Some systems support concurrent printing of a job on multiple
 2167 printers. In such cases, the server shall return a PrintCheckpoint
 2168 sequence for each printer currently assigned to the job.

2169
 2170 The ability to generate the previous internal state of the job and
 2171 the printer is dependent on the page-independence supported by the
 2172 document format. If a document format is not page-independent, it may
 2173 be possible to emulate the resumption of the job at the checkpoint by
 2174 processing through the entire document to the checkpoint page without
 2175 printing any additional pages, then continue printing pages from that
 2176 point. Some document formats may not support any form of
 2177 checkpointing.

2178
 2179 If a PauseJob operation causes a job to pause in the middle of a
 2180 document encoded in a document format that does not support
 2181 checkpointing, the server shall set the checkpoint to a value that
 2182 will force the system to resume back at the beginning of the current
 2183 copy. Obviously the ability to checkpoint a job is very
 2184 implementation-dependent.

2185
 2186 7.1.3.5 job-message-from-administrator

job-message-fro m-administrator	simpleNameSyntax	S	
------------------------------------	------------------	---	--

2187
 2188 This attribute provides a message from an operator, system
 2189 administrator or 'intelligent' process to indicate to the user the
 2190 reasons for modification or other management action taken on a job.

2191
 2192 7.1.3.6 completion-time

completion-time	generalizedTimeSyntax	S	
-----------------	-----------------------	---	--

2193
 2194 This attribute indicates the time at which this job completed.
 2195 Providing this time is useful for jobs which are retained after
 2196 printing.

2197
 2198 7.1.3.7 job-state-reasons

job-state- reasons	objectIdentifierSyntax	M	
-----------------------	------------------------	---	--

2199
 2200 This attribute identifies the reason or reasons that the job is in
 2201 the state that it is in (e.g., held, terminating, retained,
 2202 completed, etc.). The printer shall indicate the particular
 2203 reason(s) by setting the value of the job-state-reasons attribute.

2214 It is valid for the printer to set the value of the job-state-reasons
2215 attribute to the empty set.

2216
2217 The following standard values are defined:
2218 id-val-reasons-documents-needed, id-val-reasons-job-hold-set,
2219 id-val-reasons-job-print-after-specified,
2220 id-val-reasons-required-resources-not-ready,
2221 id-val-reasons-successful-completion,
2222 id-val-reasons-completed-with-warnings,
2223 id-val-reasons-completed-with-errors,
2224 id-val-reasons-cancelled-by-user,
2225 id-val-reasons-cancelled-by-operator,
2226 id-val-reasons-aborted-by-system, id-val-reasons-logfile-pending,
2227 id-val-reasons-logfile-transferring

2228
2229
2230 7.1.3.8 number-of-documents
2231

2232 2233	number-of-docum ents	cardinalSyntax	S	
--------------	-------------------------	----------------	---	--

2234
2235 This attribute indicates the number of documents in the job. The
2236 number indicates how many Print abstract-operations that specified a
2237 document (of any document-type) have been submitted for printing
2238 until job submission has been completed; at that point this attribute
2239 shall then indicate the total number of printable documents, fonts,
2240 and resource objects submitted by the client in the job. If the
2241 first Print abstract-operation does not contain a first-document
2242 component, the value of this attribute shall be 0.

2243
2244 The server shall count fonts and resource objects passed to the
2245 server by means of Print abstract-operation invocations, as documents
2246 for the purposes of this attribute.

2247
2248 NOTE - the value of the number-of-documents attribute represents the
2249 total number of documents that the client has submitted to the server
2250 during the course of job submission, regardless of whether or not the
2251 client has cancelled any of the documents. See CancelJob
2252 abstract-operation.

2253
2254 7.1.3.9 job-submission-complete
2255

2256 2257	job-submission- complete	booleanSyntax	S	
--------------	-----------------------------	---------------	---	--

2258
2259 This attribute indicates whether all documents of the print-job have
2260 been submitted (i.e., all Print abstract-operations have been invoked
2261 for the job). The value FALSE indicates that more documents are
2262 expected to be submitted for the job, by means of additional print
2263 invocations.

2264
2265 7.1.4 Job Results Handling Attributes
2266

2267 These attributes specify the actions to be undertaken after printing
2268 of a job has been completed. This includes assembly of documents

2269 into job sets, finishing operations applied to job sets, and delivery
2270 of the completed job sets.

2271 The client may specify job-results-handling attributes in:

- 2272 a) Print: all
- 2273 b) ModifyJob: all
- 2274 c) ListObjectAttributes: all

2275 7.1.4.1 job-sheets

2276 job-sheets	nameOrOidSyntax	S	
---------------------------	-----------------	---	--

2280 Attribute value types that encode identifiers that may have either a
2281 global-form or a local-form employ this generic syntax or datatype in
2282 their definitions.

2283 The global-form is of the object identifier type, and is expected to
2284 be used wherever such a value has been defined for the object in
2285 question. The local-form is intended for local implementation
2286 convenience, for use when a global-form is not available or has not
2287 been defined for the object to be identified.

2288 NOTE - It must be stressed that the local-form is not guaranteed to
2289 be unique, since there are no procedures in place to control the
2290 creation and usage of simple-name types. It is possible for two
2291 different sites to create and use the same simple-name to identify
2292 two different entities. If those two sites are interconnected
2293 subsequently, unexpected results can occur because of this
2294 duplication of simple-names. For this reason, the local-form is to
2295 be used only for purely local or temporary purposes; the global-form
2296 must be used in all other cases.

2297 This attribute specifies the auxiliary-sheets that the server shall
2298 insert into the job as separators, covers, and trailers.

2299 7.1.4.2 document-sheets

2300 document-sheets	nameOrOidSyntax	S	
--------------------------------	-----------------	---	--

2301 This attribute is similar to job-sheets. The difference is that it
2302 applies to documents within the job rather than the job itself.

2303 7.1.5 Job Event Handling Attributes

2304 7.1.5.1 notification-profile

2305 notification-profile	eventHandlingProfileSyntax	M	
-------------------------------------	----------------------------	---	--

2306 This attribute is a specification of events about which the user
2307 and/or designate are to be notified. In addition, this attribute
2308 specifies how the event notifications are to be delivered.

2323

2324 Printers may produce the same information for notification and
 2325 logging or they may produce different information, depending on
 2326 implementation.

2327

2328 7.1.6 Job Scheduling Instructions Attributes

2329

2330 These attributes provide additional hints for the scheduling of a
 2331 print-job. How a print-service uses this information in scheduling
 2332 jobs is implementation-specific.

2333

2334 The client may specify job-scheduling-instruction attributes in:

2335

- a) Print: all
- b) ModifyJob: all
- c) ListObjectAttributes: all

2336

2337 7.1.6.1 job-hold

2338

2339 job-hold	2340 booleanSyntax	S	
---------------	--------------------	---	--

2341

2342 This attribute specifies whether the print-job is a candidate for
 2343 scheduling for printing or not, when the server would otherwise place
 2344 the job in the pending or processing states. The PauseJob and
 2345 ResumeJob operations may be used independently of the value of this
 2346 attribute.

2347

2348 When the value is FALSE, the printer shall not hold the job from
 2349 being scheduled for printing, unless there are other reasons (see the
 2350 current-job-state and the job-state-reasons job-status attributes).

2351

2352 When the value is TRUE, the printer shall place the job in the held
 2353 state and add the job-hold-set value to the job's job-state-reasons
 2354 attribute and shall not schedule the print-job for printing. If the
 2355 job enters the held state because its job-hold attribute was TRUE,
 2356 a client shall reset the job's job-hold attribute to FALSE by means of
 2357 the ModifyJob operation before the printer can schedule the job for
 2358 printing. When the value is set to FALSE as a result of the
 2359 ModifyJob operation, the printer shall remove the job-hold-set value
 2360 from the job-state-reasons attribute and, if no other reasons remain,
 2361 shall change the job's current-job-state to pending so that the job
 2362 becomes a candidate for being scheduled on printer(s).

2363

2364 7.1.6.2 job-priority

2365

2366 priority	2367 prioritySyntax	S	
---------------	---------------------	---	--

2368

2369 This attribute specifies a priority for scheduling the print-job. It
 2370 is used by servers that employ a priority-based scheduling algorithm.

2371

2372 A higher value specifies a higher priority. The value 1 is defined to
 2373 indicate the lowest possible priority (a job which a priority-based
 2374 scheduling algorithm shall pass over in favour of higher priority
 2375 jobs). The value 100 is defined to indicate the highest possible
 2376 priority. Priority is expected to be evenly or 'normally' distributed
 2377 across this range. The mapping of vendor-defined priority over this

2378 range is implementation-specific. The omission of this attribute
 2379 implies that the user places no constraints concerning priority on
 2380 the scheduling of the print-job.

2381 7.1.6.3 job-print-after

2384	job-print-after	generalizedTimeSyntax	S	
------	-----------------	-----------------------	---	--

2385
 2386 This attribute specifies the calendar date and time of day after
 2387 which the print-job shall become a candidate to be scheduled for
 2388 printing.

2389 If the value of this attribute is in the future, the server shall set
 2390 the value of the job's current-job-state to held and add the
 2391 job-print-after-specified value to the job's job-state-reasons
 2392 attribute and shall not schedule the print-job for printing until the
 2393 specified date and time has passed. When the specified date and time
 2394 arrives, the server shall remove the job-print-after-specified value
 2395 from the job's job-state-reason attribute and, if no other reasons
 2396 remain, shall change the job's current-job-state to pending so that
 2397 the job becomes a candidate for being scheduled on printer(s).

2398
 2400 The printer shall assign an empty value to the job-print-after
 2401 attribute when no print after time has been assigned or when it does
 2402 not support the notion of time within the printer, so that the job
 2403 shall be a candidate for scheduling immediately.

2404 7.1.6.4 job-retention-period

2405	job-retention-p eriod	deltaTimeSyntax	S	
------	--------------------------	-----------------	---	--

2406
 2409 Delta time provides an integer value for a period of elapsed time,
 2410 measured in seconds.

2411
 2413 This attribute specifies the minimum period of time following the
 2414 completion of job processing and printing that the server shall keep
 2415 job attributes, document attributes, and document data. The server
 2416 may keep these attributes and data longer than the value of the
 2417 job-retention-period attribute.

2418
 2419 Job-retention-period specifies a lower bound on how long job
 2420 attributes, document attributes and document data shall be retained
 2421 by a server after printing has completed, whilst job-discard-time
 2422 sets an upper bound on retention of the job and document attributes
 2423 independent of whether the job is ever scheduled for, starts or
 2424 completes printing.

2425
 2426 In addition to providing status information to a user after a job has
 2427 completed printing, the job-retention-period also provides the
 2428 mechanism for retaining job's document data after it has been
 2429 printed, so that the job may be printed again, possibly with modified
 2430 attributes, such as the job-copies component of the job-results
 2431 attribute.

2433 NOTE - The mechanism to reprint the job is outside the scope of this
2434 part of ISO/IEC 10175; part 3 of this International Standard (in
2435 preparation) includes a Resubmit abstract-operation to enable this
2436 function.

2437 7.2 Document Attributes

2438 A document object contains a set of document attributes, including
2439 the document-content attribute which specifies the document data. A
2440 document object may be of type printable, font, or resource as
2441 specified by the document's document-type attribute. The printer
2442 shall create document objects as contained members of job objects in
2443 response to a client that performs one or more print-requests (see
2444 8.2.1). In addition, initial-value-document objects are created in a
2445 server by means outside the scope of this part of ISO/IEC 10175 in
2446 order to represent complete sets of default values for document
2447 attributes (see the initial-value-document object class). This
2448 subclause of ISO/IEC 10175 specifies the document attributes for both
2449 document and initial-value-document objects.

2450 In addition to the attributes specifically defined for the document
2451 and initial-value-document objects, certain of the generic attributes
2452 may also be associated with these objects.

2453 NOTE -There are no attributes that apply to both the job and document
2454 objects. Thus the server may return both job and document attributes
2455 mixed together without ambiguity in the ModifyJob and CancelJob
2456 requests.

2457 7.2.1 Document Description Attributes

2458 These attributes identify the document and its characteristics and
2459 specify the method by which the document is acquired by the
2460 print-server.

2461 The client may specify document-description attributes in:

- 2462 a) Print: all, except document-type, transfer-method, and
2463 document-content shall be passed as explicit parameters of the
2464 Print abstract-operation and shall not be passed as attributes.
- 2465 b) ModifyJob: all, except id-att-transfer-method, and
2466 id-att-document-content
- 2467 c) ListObjectAttributes: all, except id-att-document-content

2468 7.2.1.1 document-format

document-format	docFormatSyntax	S	
-----------------	-----------------	---	--

2469 This attribute identifies the overall print document format used for
2470 the document. It consists of three elements, a document-format, a
2471 document-format-variants and a document-format-version. The latter
2472 two elements are optional.

2473 The document-format element identifies a particular family of
2474 document formats, of which there may exist several versions or
2475 variants. The document-format-variants and document-format-version

elements identify a specific instance of a document format. The variant refers to a particular functional subset of a format. For example, the format PostScript has variants of level 1 and level 2, and the format PCL has several variants, including PCL4 and PCL5.

The version distinguishes among successive releases of the same basic format and variant. For example, successive versions of Xerox Interpress include versions 2.0, 2.1, 3.0, 3.1, etc.

The document-format-variants element consists of a single text string. If it is necessary to identify more than one variant, the respective variant values shall all be contained in the document-format-variants element, separated from one another by commas.

If the client omits the document-format-variants or document-format-version elements, the server may supply a format-specific default.

Proprietary values for the document-format, document-format-variants, and document-format-version elements are assigned by the owners of those formats.

7.2.1.2 document-content

document-content	documentContentSyntax	S	
------------------	-----------------------	---	--

This attribute specifies a transfer-method-specific reference for the document to be transferred. It indicates whether the content is included or referenced. If it is referenced, the reference is of syntax DOR. The DOR datatype (Distinguished Object Reference) is imported from ISO/IEC 10031-2. The DOR datatype may be used for other transfer-methods, e.g., ftam-by-server.

7.2.1.3 Reserved

7.2.1.4 transfer-method

transfer-method	objectIdentifierSyntax	S	
-----------------	------------------------	---	--

This attribute identifies the method by which the document is transferred to or acquired by the print-server.

Standard values are defined as: TBS.

Conforming client and server implementations shall support at least id-val-transfer-method-with-request, which is the default transfer-method.

7.2.2 Document Production Instruction Attributes

These attributes provide information that affect the rendering and finishing of the document and are referred to as document production

2544 instructions (DPI). DPI may also be contained in the document to be
2545 printed.

2546
2547 If there is a conflict between the value of one of these attributes,
2548 and a corresponding parameter found in the document (either implicit
2549 or explicit), the value of the attribute shall take precedence over
2550 the document parameter, unless specifically mandated otherwise in the
2551 standard defining that document format.

2552
2553 All the default-xxx attributes (e.g. default-medium) specifically
2554 allow for the document contents to override the default-xxx attribute
2555 under all conditions.

2556
2557 The client may specify document production-instruction attributes in:

- 2558
2559 a) Print: all
2560 b) ModifyJob: all
2561 c) ListObjectAttributes: all

2562
2563 7.2.2.1 default-font

2564

default-font	nameOrOidSyntax	S	
--------------	-----------------	---	--

2565
2566 This attribute identifies a font that the server shall use as the
2567 font default for the pages of the document that require a
2568 specification.

2569
2570 Standard values are defined: TBD.

2571
2572 If the document data, itself, specifies fonts, such specification
2573 shall override the default-font attribute on a page by page basis.
2574 If the document data specifies fonts which are not also values of
2575 fonts-used, then a printer may receive a document which requires
2576 fonts which are not ready. In such a case, an implementation may
2577 either abort the document or try printing the document using some
2578 alternative fonts, such as the default font.

2579
2580 7.2.2.2 default-medium

2581
2582

default-medium	nameOrOidSyntax	S	
----------------	-----------------	---	--

2583
2584 This attribute identifies a medium that the server shall use as the
2585 medium default for the pages of the document that require a
2586 specification.

2587
2588 Standard values are defined: TBD

2589
2590 If the document data, itself, specifies media, such specification
2591 shall override the default-medium attribute on a page by page basis.
2592 If the document data specifies media which are not also values of
2593 media-used, then a printer may receive a document which requires
2594 media that are not ready. In such a case, an implementation may
2595 either abort the document or try printing the document on some
2596 alternative medium, such as the default medium.

2599
2600
2601
2602
2603
2604
2605
2606
2607

A client has numerous ways to specify the media to be used when printing a document and different document pages can be specified in different ways. The client can specify the media in the document contents or with attributes. Some attributes override the document contents, and other attributes may be overridden by the document contents. In addition, the client can specify the media by name or by the input-tray containing it.

2608
2609
2610
2611
2612
2613

Before printing each page of a document, the server determines the medium or input-tray for that page by finding the first condition in the list of numbered steps below that is satisfied. For this discussion, either the medium or the input-tray is sufficient information:

2614
2615
2616
2617
2618
2619
2620
2621
2622
2623
2624
2625
2626
2627
2628
2629
2630
2631
2632
2633
2634
2635
2636
2637

- a) If page-media-select has a medium value for the current page, use that medium, regardless of document contents and other attributes.
- b) If input-tray-select has a value, use that tray.
- c) If the document contents specify a medium, and that medium is the same as the value of one of the original-medium elements in the media-substitution attribute, then use the corresponding substitution-medium in the media-substitution attribute.
- d) If the document contents specify a medium, use that medium.
- e) If the document contents specify an input-tray, use that input-tray.
- f) If the default-medium has a value, and the document format interpreter allows its use, and that medium is the same as the value of one of the original-medium elements in media-substitution attribute, then use the corresponding substitution-medium in the media-substitution attribute.
- g) If the default-medium has a value and the document format interpreter allows its use, use the default-medium.
- h) If the default-input-tray has a value and the document format interpreter allows its use, use the default-input-tray.
- i) Use the medium or input-tray selected by the document format processor in the printer. This selection is implementation-dependent.

2638
2639

7.2.2.3 number-up

2640
2641
2642
2643
2644
2645
2646
2647
2648
2649
2650
2651
2652
2653
2654

number-up	cardinalOrNameOrOidSyntax	S	
-----------	---------------------------	---	--

A CardinalSyntax allows attribute values that can specify either a Cardinal or an OID (that normally names a Cardinal).

This attribute specifies the number of source page-images to impose upon a single instance of a selected medium. The attribute can be specified either by a number directly or by naming an imposition object which specifies some particular number-up imposition.

In general, only certain numeric values are valid for this attribute, depending upon the server and printer implementations to which the print-request is directed. A value of 0 or none shall suppress any server default number up, if any.

This attribute primarily controls the translation, scaling and rotation of page images, but a site may choose to add embellishments, such as borders to each logical page. A site may even choose to add an attribute to control the presence or characteristics of such embellishments.

The following standard values are defined: id-val-generic-none, id-val-imposition-simple-1-up, id-val-imposition-simple-2-up, id-val-imposition-simple-4-up.

NOTE - The value 0 or none specifies that no convenience imposition functions shall be performed; 0 or none is needed to suppress any special number-up operation because a value of 1 for some sites may cause the server to alter the placement, or size of the page image, or to add embellishments, such as borders or to rotate the page depending on content-orientation.

The server may support three values for number-up besides 0 (and id-val-generic-none), namely 1 (and id-val-imposition-1-up), 2 (and id-val-imposition-simple-2-up) and 4 (and id-val-imposition-simple-4-up), which this document will reference by the respective names of 0-up, 1-up, 2-up and 4-up, henceforth. These 1-up, 2-up and 4-up values provide a simple means for users to request the printing of compact documents of a temporary or informal nature.

7.2.2.4 finishing

finishing	finishingSyntax	M	
-----------	-----------------	---	--

This attribute identifies a sequence of one or more finishing-processes to be applied to each copy of the printed document.

Finishing encompasses the operations that may be applied to the media output of a print-job. Examples include stapling, saddle-stitching, hole-drilling, binding with tape, etc.

This attribute allows the requester to specify one or more individual finishing processes may be specified in the finishing attribute. Each of the individual processes is specified by including the required parameters for each of the individual finishing processes in the finishing attribute.

Standard values for this attribute are defined: TBD.

7.2.2.5 sides

sides	sidesSyntax	S	
-------	-------------	---	--

This attribute specifies the number of printable surfaces of the medium to be imaged. SidesSyntax is an integer restricted to the range {1..2}.

7.2.2.6 copy-count

2710

copy-count	cardinalSyntax	S	
------------	----------------	---	--

2711

This attribute specifies the number of copies of the documents, or of the selected pages of the document, to be printed.

2712

A value of 1 for copy-count shall generate a single human perceptible copy of the electronic document. If a value of 0 is supplied, then:

- a) if the server supports specification of the value 0, the job shall be processed normally, but no print output shall be produced; or
- b) if the server does not support specification of the value 0, the server shall return an unsupported-attribute-value AttributeError.

2713

7.2.2.7 reset-printer

2714

reset-printer	booleanSyntax	S	
---------------	---------------	---	--

2715

This attribute specifies that the interpreter and/or printer be reset after processing this document (in a multiple document job).

2716

This attribute would normally be used to suppress the resetting of non-page-independent interpreters and/or printers so that the previously defined state (e.g. font resources, forms, etc.) is inherited by the next document in the job.

2717

This attribute has no meaning or effect for document formats that are page-independent, such as SPDL.

2718

A server shall ensure that a printer is always reset after the last document in a job, independent of whether reset-printer is TRUE or FALSE for the last document, so that jobs are independent of one another.

2719

7.2.3 Document Characteristics Attributes

2720

This group of attributes describes the characteristics of the document to be printed.

2721

The values provided by these attributes are intended to assist the print-server in validating and scheduling the print-job. Providing these attributes independent of the document allows the server to schedule a job or to validate the resources required to print the document without interpreting the contents of the document. This provides the opportunity for a server to support a broad set of document formats yet still support fast efficient scheduling and validation of each job. The values provided by these attributes are also intended to provide parameters to print-server services, such as a text formatter or imposition's number-up procedure.

2722

The values of these attributes are hints to the server about production instructions and resources needed to print a document, but the printer does not use these attributes during the actual printing of a document. The values of these attributes are intended to come

2765 from the document content, but some may come from intentions of the
2766 client. The values of these attributes are assigned as follows:
2767 a) First the client may, at its option, either omit these
2768 attributes, or assign values to any of them based on the document
2769 content or client intent.
2770 b) The server may then, at its option, either leave any of these
2771 attributes unchanged, or assign values to any of them based on its
2772 own analysis of the document contents. If the document contains
2773 incomplete information or no information about the attribute, or
2774 the server cannot ascertain the information, the server may choose
2775 to assign some default value. For *xxx-used* attributes which have
2776 a corresponding default-*xxx*, the server shall use the value of the
2777 default-*xxx* as the default. When a default is used with a MULTI
2778 VALUE attribute, it may be one of several values in the attribute,
2779 e.g. some pages may have an explicit medium, others may use a
2780 default.
2781 c) Finally, the server may choose to assign a value to these
2782 attributes only when the client does not supply a value, or the
2783 server may choose to override whatever the client supplies, or the
2784 server may also choose to do nothing, regardless of what the
2785 client supplies.

2786
2787 If the client performs the *ModifyJob* operation on any of these
2788 attributes, the server shall follow rules b and c, above, for the
2789 modified attributes. Thus, in effect, the server shall have control
2790 over whether to honor a client's requested change.

2791
2792 For validation and scheduling, the server shall use these attributes
2793 and shall not examine the document contents. However, according to
2794 the rules above, the server may have examined the document contents
2795 earlier to assign values to these attributes.

2796
2797 Processes, such as text formatting and number-up may use some of
2798 these attributes as parameters, or they may do their own independent
2799 analysis during the procedure.

2800
2801 The client may specify document-characteristic attributes in:

- 2802 a) *Print*: all
- 2803 b) *ModifyJob*: all
- 2804 c) *ListObjectAttributes*: all

2805
2806 7.2.3.1 *fonts-used*

2807
2808
2809

<i>fonts-used</i>	<i>fontReferenceSyntax</i>	M	
-------------------	----------------------------	---	--

2810
2811 7.2.3.2 *media-used*

2812
2813
2814

<i>media-used</i>	<i>nameOrOidSequenceSyntax</i>	S	
-------------------	--------------------------------	---	--

2815
2816
2817 This attribute identifies the media specified in the document.

2820 The values in this attribute should contain the actual media required
2821 for printing the document, taking into account the results of
2822 interpreting the document contents, and applying the attributes:
2823 page-media-select, input-tray-select, media-substitution,
2824 default-medium and default-input-tray.

2825 Standard values for this attribute are defined: TBD

2826 This attribute contains a SEQUENCE of values rather than a SET
2827 because the ith element of this attribute corresponds to the ith
2828 attribute of the assured-reproduction-areas-used attribute.

2829 This attribute is intended for scheduling and validation. The server
2830 uses this attribute with the printer attributes media-supported for
2831 validation and media-ready for scheduling.

2832 7.2.4 Document Status Attributes

2833 These attributes specify the document status, before, during, and
2834 after processing of the document by the server. The server shall
2835 create the document object with these attributes (if implemented) and
2836 shall assign appropriate values to each such document-status
2837 attribute.

2838 The client may specify document-status attributes in:

- 2839 a) Print: none
- 2840 b) ModifyJob: none
- 2841 c) ListObjectAttributes: all

2842 7.2.4.1 document-sequence-number

2843 document-	cardinalSyntax	S	
2844 sequence-number			

2845 This attribute specifies the number of this document in relation to
2846 the set of documents in this job. The first document in the job is
2847 numbered 1.

2848 The document-sequence-number is not passed as an input attribute in
2849 the Print abstract-operation. Documents are assumed to be submitted
2850 in order (i.e., document number 1 followed by document number 2,
2851 etc.).

2852 A server shall return a value of 0 for this attribute if the first
2853 Print abstract-operation has not submitted a document (e.g., the
2854 first-document element is omitted in the create-job element of the
2855 Print abstract-operation).

2856 7.3 Operation Attributes

2857 TBD

2858 7.4 Printer Attributes

2859 A printer object may represent either a physical printer or a logical
2860 printer, or both.

2876

A physical printer is a printer object containing a set of printer object attributes that represent an output device capable of rendering a document in visible form. Examples include electronic and electro-mechanical printers such as laser printers, ink-jet printers, and various kinds of impact printers, but may include other types of output devices such as microfiche imagers and plotters as well.

2884

A logical printer is a printer object containing a set of printer object attributes that have been grouped under one name in order to represent some class of printer or printing effect. For example, an administrator might define a single logical printer to represent all of the physical printers of the same type and capability in a single location, associated with a particular server. A user/client would normally send a print-job to a logical printer, and allow the server to assign the job to a particular physical printer based on the relative load and availability of the printers under its control, thus providing a load balancing service. However, ISO/IEC 10175 does not preclude a user/client from sending a print-job to a physical printer. Such a restriction is up to the policy of the system administrator and the access control that the administrator specifies.

2899

Logical and physical printer objects may be defined to specify that a particular set of default values for job and document attributes are to be assumed when a client identifies that printer. Such things as default media, fonts, finishing operations, etc., may be specified for a job simply by sending the job to a particular logical or physical printer. When the client identifies a logical printer, the server shall assign the job to a particular physical-printer that the administrator has explicitly associated with the logical-printer. Depending on implementation, the server may assign the job when the job is received, or the server may delay the assignment, until a physical printer is free, thereby achieving more dynamic load balancing between several physical printers.

2912

A printer object shall have one of three realizations, as specified by the value of its printer-realization attribute logical, physical, or logical-and-physical. The logical-and-physical value is used in the simple and frequent case when the system administrator creates a single printer object to represent both a logical printer and a physical printer. This would be the case when a single physical-printer is associated with a single print-server or when the administrator has decided not to offer additional sets of defaults for the physical printer. In order to create more than one set of defaults for a physical printer, the system manager shall create an associated logical printer and sets its printer-realization to logical.

2925

If the printer-realization attribute is not implemented, the server shall treat all printer objects as if the printer-realization attribute had the value logical-and-physical.

2929

Throughout ISO/IEC 10175, the term printer shall refer to both logical and physical printers, and shall be used when no distinction is being made between logical and physical printers. The term

2933 logical printer shall be used for a printer object whose
 2934 printer-realization attribute has the value logical or
 2935 logical-and-physical. The term physical printer shall be used for a
 2936 printer object whose printer-realization attribute has the value
 2937 physical or logical-and-physical.

2938
 2939 The attributes defined in this subclause provide information about a
 2940 particular logical or physical printer; all of the attributes apply
 2941 to logical and physical printers.

2942 In addition to the attributes specifically defined for this object,
 2943 certain of the generic attributes may also be associated with this
 2944 object. For example, when requesting a list of attribute values for
 2945 an object of this class, the client may identify one or more of the
 2946 generic attributes in the following table, for which the server shall
 2947 return values if the attributes are implemented.

2950 7.4.1 printer-name

2952 printer-name	simpleNameSyntax	S	
-------------------	------------------	---	--

2953
 2954 This attribute uniquely identifies the printer.

2955 7.4.2 printer-state

2959 printer-state	objectIdentifierSyntax	S	
--------------------	------------------------	---	--

2960
 2961 This attribute identifies the current state of the printer. The LDPA
 2962 protocol support all values for printer states, however printers are
 2963 not required to generate all the printer states, only those which are
 2964 appropriate for the particular implementation.

2965
 2966 The following standard values are defined:
 2967 id-val-printer-state-unknown, id-val-printer-state-idle,
 2968 id-val-printer-state-printing, id-val-printer-state-needs-attention,
 2969 id-val-printer-state-paused, id-val-printer-state-shutdown,
 2970 id-val-printer-state-job-start-wait,
 2971 id-val-printer-state-job-end-wait,
 2972 id-val-printer-state-job-password-wait,
 2973 id-val-printer-state-needs-key-operator,
 2974 id-val-printer-state-connecting-to-printer,
 2975 id-val-printer-state-timed-out

2976 7.4.3 message

2979 message	messageSyntax	S	
--------------	---------------	---	--

2980
 2981 This attribute provides a message from an operator, system
 2982 administrator or 'intelligent' process to indicate to the user the
 2983 reasons for modification or other management action taken on a job.

2984 7.4.4 printer-initial-value-job

2987	printer-	nameOrOidSyntax	S	
2988	initial-value-			
2989	job			

2990
 2991 This attribute identifies an initial-value-job object in the server
 2992 for this printer. An initial-value-job object contains those
 2993 attributes that the server shall default when a print-job is
 2994 submitted, if the client does not specify an initial-value-job
 2995 attribute with the print-request, the server shall use the
 2996 initial-value-job object specified by the printer's
 2997 printer-initial-value-job attribute to initialize the job object when
 2998 the job is submitted and set the job's initial-value-job attribute to
 2999 the value of the printer-initial-value-job attribute.
 3000

3001 In an initial-value-job object, SINGLE VALUE attributes (1) shall
 3002 contain one attribute-value or (2) may specify no attribute values,
 3003 i.e., an empty attribute-value (see DPA 9.1.2). MULTI VALUE
 3004 attributes shall contain zero or more attribute-values. Attributes
 3005 containing no values either (1) are not supported by the printer, or
 3006 (2) are expected to be defaulted by the printer hardware itself.
 3007

3008 LDPA requires that a printer shall implement the
 3009 printer-initial-value-job attribute. This requirement is important,
 3010 so that the server defaulting mechanism shall permit a client to
 3011 submit a print-job with many attributes omitted, and the server
 3012 supplies default values.
 3013

3014 7.4.5 printer-initial-value-document

3015	printer-	nameOrOidSyntax	S	
3016	initial-value-			
3017	document			

3018 This attribute identifies an initial-value-document object in the
 3019 server for this printer. If the client does not specify an
 3020 initial-value-document attribute with the print-request, the server
 3021 shall use the initial-value-document object specified by the
 3022 printer's printer-initial-value-document attribute to initialize the
 3023 document object when the document is submitted and set the document's
 3024 initial-value-document attribute to the value of the
 3025 printer-initial-value-document attribute.
 3026

3027 A printer may specify only one initial-value-document object, which
 3028 will be used to initialize all document object instances targeted at
 3029 this printer unless overridden by the initial-value-document
 3030 attribute as described above. Each document in a job may therefore
 3031 use a different initial-value-document object even though the printer
 3032 may specify only one.
 3033

3034 In an initial-value-document object, SINGLE VALUE attributes (1)
 3035 shall contain one attribute value or (2) may specify no attribute
 3036 values, i.e. an empty attribute-value (DPA see 9.1.2). MULTI VALUE
 3037 attributes shall contain zero or more attribute-values. Attributes
 3038 containing no values either (1) are not supported by the printer, or
 3039 (2) are expected to be defaulted by the printer hardware itself.
 3040

(2) are expected to be defaulted by the printer hardware itself.

LDPA requires that a printer shall implement the printer-initial-value-document attribute. This requirement is important so that the server defaulting mechanism shall permit a client to submit a document print-request with many attributes omitted, and the server supplies default values.

7.4.6 fonts-supported

fonts-supported	fontReferenceSyntax	M	
-----------------	---------------------	---	--

This attribute identifies the font resources supported by this printer.

7.4.7 fonts-ready

fonts-ready	fontReferenceSyntax	M	
-------------	---------------------	---	--

This attribute identifies the font resources currently ready to be used on this printer.

7.4.8 media-supported

media-supported	nameOrOidSyntax	M	
-----------------	-----------------	---	--

This attribute identifies the media supported by this printer.

7.4.9 media-ready

media-ready	nameOrOidSyntax	M	
-------------	-----------------	---	--

This attribute identifies the media currently ready to be used on this printer.

7.4.10 printer-associated-printers

printer-associated-printers	distinguishedNameStringSyntax	M	
-----------------------------	-------------------------------	---	--

This attribute identifies the logical/physical printers associated with this physical/logical printer.

7.4.11 document-formats-supported

document-formats-supported	docFormatSyntax	M	
----------------------------	-----------------	---	--

This attribute identifies the document-formats, including the

3094 document-format-variants and document-format-versions, supported by
 3095 the output device and the server software collectively. This set
 3096 includes both the formats that are native to the output device and
 3097 those formats that the server software can translate to one that is
 3098 native to the output device. From the client's point of view, this
 3099 set contains all formats in which documents can be submitted to this
 3100 printer.

3101
 3102 Proprietary document format identifiers, variants, and versions are
 3103 assigned by the owners of those formats.

3104
 3105 7.4.12 numbers-up-supported
 3106

numbers-up-supported	numbersUpSupportedSyntax	S	
----------------------	--------------------------	---	--

3109
 3110 This attribute identifies the number-up values and imposition objects
 3111 supported by this printer. The cardinal-range is an alternative
 3112 (shorthand) way of specifying consecutive cardinal-values.

3113
 3114 There are no standard values defined.

3115
 3116 7.4.13 finishings-supported
 3117

finishings-supported	nameOrOidSyntax	S	
----------------------	-----------------	---	--

3120
 3121 This attribute identifies the per-document finishing objects
 3122 supported by this printer, that is the server-installed finishing
 3123 objects that may be used as values of the finishing document
 3124 attribute.

3125
 3126 NOTE: What are the values of this attribute since we have no
 3127 Finishing objects.

3128
 3129 7.4.14 sides-supported
 3130

sides-supported	sidesSyntax	M	
-----------------	-------------	---	--

3133
 3134 This attribute indicates the values of the sides attribute supported
 3135 by this printer, i.e., the different numbers of surfaces of a medium
 3136 that can be imaged by this printer.

3137
 3138 7.4.15 job-sheets-supported
 3139

job-sheets-supported	nameOrOidSyntax	M	
----------------------	-----------------	---	--

3142
 3143 This attribute identifies the auxiliary-sheet-s values supported by
 3144 this printer.

3145
 3146 To allow no job sheets, the system administrator shall include the

3147 value id-val-generic-none as a value for this attribute. The client
 3148 specifies that there are no job sheets by using the value
 3149 id-val-generic-none as the value of the job-sheets attribute.
 3150

3151 If the job-sheets attribute is not specified or contains a value
 3152 which the printer does not support, and the job-sheets value is
 3153 non-compulsory (so that the server accepts the job), then the server
 3154 may select from among the values of this attribute. The server shall
 3155 not select the value id-val-generic-none unless it is the only value
 3156 specified for the job-sheets-supported attribute.
 3157

3158 NOTE - It is preferable for the server to produce some job
 3159 auxiliary-sheet, even if not the desired one, rather than produce
 3160 none at all.
 3161

3162 7.4.16 document-sheets-supported

3164 document- 3165 sheets- 3166 supported	3164 nameOrOidSyntax	3164 M	
---	---------------------------------	-------------------	--

3167
 3168 This attribute identifies the auxiliary-sheets values supported by
 3169 this printer.
 3170

3171 To allow no document sheets, the system administrator shall include
 3172 the value id-val-generic-none as a value for this attribute. The
 3173 client specifies that there are no document sheets by using the value
 3174 id-val-generic-none as the value of the document-sheets attribute.
 3175

3176 If the document-sheets attribute is not specified or contains a value
 3177 which the printer does not support, and the document-sheets value is
 3178 non-compulsory (so that the server accepts the job), then the server
 3179 may select from among the values of this attribute. The server shall
 3180 not select the value id-val-generic-none unless it is the only value
 3181 specified for the document-sheets-supported attribute.
 3182

3183 NOTE - It is preferable for the server to produce some job
 3184 auxiliary-sheet, even if not the desired one, rather than produce
 3185 none at all.
 3186

3187 7.4.17 maximum-copies-supported

3189 maximum-copies- 3190 supported	3189 cardinalSyntax	3189 S	
--	--------------------------------	-------------------	--

3191
 3192 This attribute indicates the maximum number of copies of a document
 3193 that can be rendered by this printer in a single print-job.
 3194

3195 A server shall ensure that neither a document's copy-count attribute
 3196 nor any single job-copies element of a ResultsProfile exceeds the
 3197 value specified in this attribute. A server may ensure that for each
 3198 document the product of the document's copy-count and the sum of all
 3199 job-copies in all result-sets does not exceed this value.
 3200

3201 A value of 0 shall indicate there is no limit on the maximum number

3202 of document copies for this printer.

3203
3204 7.4.18 notification-delivery-methods-supported
3205

3206 notification- 3207 delivery- 3208 methods- 3209 supported	TBD	S	
---	-----	---	--

3210
3211
3212 7.4.19 physical-printers-supported
3213

3214 physical- 3215 printers- 3216 supported	distinguishedNameStringSyn tax	M	
--	-----------------------------------	---	--

3217
3218 This attribute identifies the physical printers (printer's
3219 realization attribute is either physical or logical-and-physical)
3220 supported by this server.

3221
3222 7.4.20 Logical-printers-supported
3223

3224 logical-printer 3225 s-supported	distinguishedNameStringSyn tax	M	
--	-----------------------------------	---	--

3226
3227 This attribute identifies the logical printers (printer's realization
3228 attribute is either logical or logical-and-physical) supported by
3229 this server.

3230
3231 7.4.21 events-supported
3232

3233 events-supporte 3234 d	objectIdentifierSyntax	S	
--	------------------------	---	--

3235
3236 This attribute identifies the event types and event classes supported
3237 by this printer.

3238
3239 7.4.22 transfer-methods-supported
3240

3241 transfer-method 3242 s-supported	objectIdentifierSyntax	M	
--	------------------------	---	--

3243
3244 This attribute identifies the transfer-methods supported by this
3245 server.

3246
3247 7.4.23 locales-supported
3248
3249 TBD

3250
3251 7.4.24 multiple-documents-supported
3252
3253

3254	multiple-docume nts-supported	booleanSyntax	S	
------	----------------------------------	---------------	---	--

3255
3256
3257 This attribute indicates whether this object (printer or server) is
3258 capable of processing and printing multiple documents per job.

3259
3260 This printer shall not support any operation involving multiple
3261 documents unless this attribute has the value TRUE. In spite of this
3262 requirement, it is still a printer driver implementation option of
3263 whether to support modifying and/or cancelling individual documents
3264 within a multi-document job or not.

3265
3266 7.4.28 cancel-individual-document-supported
3267

3268	cancel-individu al-document-sup ported	booleanSyntax	S	
------	--	---------------	---	--

3268
3269
3270 This attribute indicates whether this object (printer or server) is
3271 capable of cancelling the printing of individual documents within a
3272 multiple document job.

3273
3274 7.4.29 modify-individual-document-supported
3275
3276

3277	modify- individual- document- supported	booleanSyntax	S	
------	--	---------------	---	--

3277
3278 This attribute indicates whether the server is capable of modifying
3279 the print-request parameters for individual documents within a
3280 multiple document job.

3281
3282 7.5 Initial Value Job Attributes
3283

3284 The attributes for an Initial Value Job object can be any of the Job
3285 object attributes defined in section 7.1.

3286
3287 7.6 Initial Value Document Attributes
3288

3289 The attributes for an Initial Value Document object can be any of the
3290 Document object attributes defined in section 7.2.

3291
3292 7.7 Relationship to ISO/IEC 10175 Conformance Levels
3293

3294 In ISO/IEC 10175 DPA Appendix E, three Conformance Levels are
3295 defined. For levels 1 and 2, an additional set of attributes for
3296 multiple-document job support are defined. These additional levels
3297 are indicated by the letter M. Thus, level 2M indicates support for
3298 a basic set of operations and attributes with additional support for
3299 multiple-document jobs. The scope of LDPA is essentially the same as
3300 level 2M as defined by DPA.

3308 LDPA is explicitly designed to be extensible. This means that in
3309 addition to the attributes defined in this specification, specific
3310 implementation instances may support not only the basic protocol as
3311 defined in this specification, but might add vendor specific
3312 extenstions.
3313

3314 Also, for the core set of attributes listed in this specification, it
3315 is not required that a conforming server support all (standard)
3316 values of all supported attributes. For example, it is not required
3317 that a printer implement all finishing methods indicated by the
3318 standard values.
3319

3320 The explicit requirement of the term "supported", with respect to one
3321 of the attributes that deal with printer functions or resources, is
3322 that the server shall recognize the attribute and those values that
3323 are supported, and shall be able to respond to a query about which
3324 values that printer does, in fact, support.
3325

3326 8. Security Considerations

3327 This protocol does not identify any new security mechanisms. The
3328 authentication mechanisms (as well as extenstions) built into the RPC
3329 infrastructure are recommended. Also, the Bind operation described
3330 in section 5 supports the notion of authentication via simple or
3331 credential based arguments.
