17 Status of this Memo

18 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of
19 [RFC2026]. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its
20 areas, and its working groups. Note that other groups may also distribute working documents as Internet-
21 Drafts.

22 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or
23 obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or
24 to cite them other than as "work in progress".

25 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

26 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>.

27 Abstract

28 This document is one of a set of documents, which together describe all aspects of a new Internet Printing
29 Protocol (IPP). IPP is an application level protocol that can be used for distributed printing using Internet
30 tools and technologies. This document describes a simplified model consisting of abstract objects, their
31 attributes, and their operations that is independent of encoding and transport. The model consists of a
32 Printer and a Job object. A Job optionally supports multiple documents. IPP 1.1 semantics allow end-users
33 and operators to query printer capabilities, submit print jobs, inquire about the status of print jobs and
34 printers, cancel, hold, release, and restart print jobs. IPP 1.1 semantics allow operators to pause, resume,
35 and purge (jobs from) Printer objects. This document also addresses security, internationalization, and
36 directory issues.

37 The full set of IPP documents includes:

38 Design Goals for an Internet Printing Protocol [RFC2567]

39 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]

40 Internet Printing Protocol/1.1: Model and Semantics (this document)
41 Internet Printing Protocol/1.1: Encoding and Transport [IPP-PRO]
42 Internet Printing Protocol/1.1: Implementer's Guide [IPP-IIG]
43 Mapping between LPD and IPP Protocols [RFC2569]
44

45 The "Design Goals for an Internet Printing Protocol" document takes a broad look at distributed printing
46 functionality, and it enumerates real-life scenarios that help to clarify the features that need to be included
47 in a printing protocol for the Internet. It identifies requirements for three types of users: end users,
48 operators, and administrators. It calls out a subset of end user requirements that are satisfied in IPP/1.0. A
49 few OPTIONAL operator operations have been added to IPP/1.1.

50 The "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol" document
51 describes IPP from a high level view, defines a roadmap for the various documents that form the suite of
52 IPP specification documents, and gives background and rationale for the IETF working group's major
53 decisions.

54 The "Internet Printing Protocol/1.1: Encoding and Transport" document is a formal mapping of the abstract
55 operations and attributes defined in the model document onto HTTP/1.1. It defines the encoding rules for a
56 new Internet MIME media type called "application/ipp". This document also defines the rules for
57 transporting over HTTP a message body whose Content-Type is "application/ipp". This document defines a
58 new scheme named 'ipp' for identifying IPP printers and jobs. Finally, this document defines
59 interoperability rules for supporting IPP/1.0 clients. **Issue 33**

60 The "Internet Printing Protocol/1.1: Implementer's Guide" document gives insight and advice to
61 implementers of IPP clients and IPP objects. It is intended to help them understand IPP/1.1 and some of the
62 considerations that may assist them in the design of their client and/or IPP object implementations. For
63 example, a typical order of processing requests is given, including error checking. Motivation for some of
64 the specification decisions is also included.

65 The "Mapping between LPD and IPP Protocols" document gives some advice to implementers of gateways
66 between IPP and LPD (Line Printer Daemon) implementations.

Table of Contents

67	Table of Contents		
68	1. Introduction.....		10
69	1.1 Simplified Printing Model		11
70	2. IPP Objects.....		13
71	2.1 Printer Object		13
72	2.2 Job Object		15
73	2.3 Object Relationships		16
74	2.4 Object Identity.....		17
75	3. IPP Operations		19
76	3.1 Common Semantics		20
77	3.1.1 Required Parameters		20
78	3.1.2 Operation IDs and Request IDs		21
79	3.1.3 Attributes		21
80	3.1.4 Character Set and Natural Language Operation Attributes.....		22
81	3.1.4.1 Request Operation Attributes.....		23
82	3.1.4.2 Response Operation Attributes		25
83	3.1.5 Operation Targets.....		26
84	3.1.6 Operation Response Status Codes and Status Messages		28
85	3.1.6.1 "status-code" (type2 enum)		28
86	3.1.6.2 "status-message" (text(255))		28
87	3.1.6.3 "detailed-status-message" (text(MAX)) Issue 35		29
88	3.1.6.4 "document-access-error" (text(MAX)) Issue 35		29
89	3.1.7 Unsupported Attributes		29
90	3.1.8 Versions		31
91	3.1.9 Job Creation Operations.....		32
92	3.2 Printer Operations		34
93	3.2.1 Print-Job Operation.....		34
94	3.2.1.1 Print-Job Request.....		35
95	3.2.1.2 Print-Job Response.....		38
96	3.2.2 Print-URI Operation.....		40
97	3.2.3 Validate-Job Operation		41
98	3.2.4 Create-Job Operation		41
99	3.2.5 Get-Printer-Attributes Operation		42
100	3.2.5.1 Get-Printer-Attributes Request		42
101	3.2.5.2 Get-Printer-Attributes Response		44
102	3.2.6 Get-Jobs Operation		45
103	3.2.6.1 Get-Jobs Request.....		45
104	3.2.6.2 Get-Jobs Response		46
105	3.2.7 Pause-Printer Operation.....		47
106	3.2.7.1 Pause-Printer Request		49
107	3.2.7.2 Pause-Printer Response.....		49
108	3.2.8 Resume-Printer Operation		49

109	3.2.9	Purge-Jobs Operation.....	50
110	3.3	Job Operations.....	51
111	3.3.1	Send-Document Operation.....	51
112	3.3.1.1	Send-Document Request.....	52
113	3.3.1.2	Send-Document Response	53
114	3.3.2	Send-URI Operation	54
115	3.3.3	Cancel-Job Operation	54
116	3.3.3.1	Cancel-Job Request.....	55
117	3.3.3.2	Cancel-Job Response	55
118	3.3.4	Get-Job-Attributes Operation	56
119	3.3.4.1	Get-Job-Attributes Request.....	56
120	3.3.4.2	Get-Job-Attributes Response	57
121	3.3.5	Hold-Job Operation.....	58
122	3.3.5.1	Hold-Job Request.....	59
123	3.3.5.2	Hold-Job Response	59
124	3.3.6	Release-Job Operation	59
125	3.3.7	Restart-Job Operation	60
126	3.3.7.1	Restart-Job Request.....	61
127	3.3.7.2	Restart-Job Response	62
128	4.	Object Attributes.....	62

345 1. Introduction

346 The Internet Printing Protocol (IPP) is an application level protocol that can be used for distributed printing
347 using Internet tools and technologies. IPP version 1.1 (IPP/1.1) focuses only on end user functionality.
348 This document is just one of a suite of documents that fully define IPP. The full set of IPP documents
349 includes:

350 Design Goals for an Internet Printing Protocol [RFC2567]
351 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]
352 Internet Printing Protocol/1.1: Model and Semantics (this document)
353 Internet Printing Protocol/1.1: Encoding and Transport [IPP-PRO]
354 Internet Printing Protocol/1.1: Implementer's Guide [IPP-IIG]
355 Mapping between LPD and IPP Protocols [RFC2569]
356

357 Anyone reading these documents for the first time is strongly encouraged to read the IPP documents in the
358 above order.

359 This document is laid out as follows:

- 360 - The rest of Section 1 is an introduction to the IPP simplified model for distributed printing.
- 361 - Section 2 introduces the object types covered in the model with their basic behaviors, attributes, and
362 interactions.
- 363 - Section 3 defines the operations included in IPP/1.1. IPP operations are synchronous, therefore, for
364 each operation, there is a both request and a response.
- 365 - Section 4 defines the attributes (and their syntaxes) that are used in the model.
- 366 - Sections 5 - 6 summarizes the implementation conformance requirements for objects that support the
367 protocol and IANA considerations, respectively.
- 368 - Sections 7 - 11 cover the Internationalization and Security considerations as well as References,
369 Author contact information, and Formats for Registration Proposals.
- 370 - Sections 12 - 14 are appendices that cover Terminology, Status Codes and Messages, and "media"
371 keyword values.

372 Note: This document uses terms such as "attributes", "keywords", and "support". These
373 terms have special meaning and are defined in the model terminology section 12.2.
374 Capitalized terms, such as MUST, MUST NOT, REQUIRED, SHOULD, SHOULD NOT,
375 MAY, NEED NOT, and OPTIONAL, have special meaning relating to conformance. These
376 terms are defined in section 12.1 on conformance terminology, most of which is taken from
377 RFC 2119 [RFC2119].

- 378 - Section 15 is an appendix that helps to clarify the effects of interactions between related attributes and
379 their values.
- 380 - Section 16 is an appendix that enumerates the subset of Printer attributes that form a generic directory
381 schema. These attributes are useful when registering a Printer so that a client can find the Printer
382 not just by name, but by filtered searches as well.
- 383 - Section 17 is an appendix summarizing the additions and changes from the IPP/1.0 "Model and
384 Semantics" document [RFC2566] to make this IPP/1.1 document.
- 385 - Section 18 is the full copyright notice.

386 1.1 Simplified Printing Model

387 In order to achieve its goal of realizing a workable printing protocol for the Internet, the Internet Printing
388 Protocol (IPP) is based on a simplified printing model that abstracts the many components of real world
389 printing solutions. The Internet is a distributed computing environment where requesters of print services
390 (clients, applications, printer drivers, etc.) cooperate and interact with print service providers. This model
391 and semantics document describes a simple, abstract model for IPP even though the underlying
392 configurations may be complex "n-tier" client/server systems. An important simplifying step in the IPP
393 model is to expose only the key objects and interfaces required for printing. The model described in this
394 model document does not include features, interfaces, and relationships that are beyond the scope of the
395 first version of IPP (IPP/1.1). IPP/1.1 incorporates many of the relevant ideas and lessons learned from
396 other specification and development efforts [HTPP] [ISO10175] [LDPA] [P1387.4] [PSIS] [RFC1179]
397 [SWP]. IPP is heavily influenced by the printing model introduced in the Document Printing Application
398 (DPA) [ISO10175] standard. Although DPA specifies both end user and administrative features, IPP
399 version 1.1 (IPP/1.1) focuses primarily on end user functionality with a few additional OPTIONAL operator
400 operations.

401 The IPP/1.1 model encapsulates the important components of distributed printing into two object types:

- 402 - Printer (Section 2.1)
- 403 - Job (Section 2.2)

404

405 Each object type has an associated set of operations (see section 3) and attributes (see section 4).

406 It is important, however, to understand that in real system implementations (which lie underneath the
407 abstracted IPP/1.1 model), there are other components of a print service which are not explicitly defined in
408 the IPP/1.1 model. The following figure illustrates where IPP/1.1 fits with respect to these other
409 components.

441 An IPP Printer object encapsulates the functions normally associated with physical output devices along
442 with the spooling, scheduling and multiple device management functions often associated with a print
443 server. Printer objects are optionally registered as entries in a directory where end users find and select them
444 based on some sort of filtered and context based searching mechanism (see section 16). The directory is
445 used to store relatively static information about the Printer, allowing end users to search for and find
446 Printers that match their search criteria, for example: name, context, printer capabilities, etc. The more
447 dynamic information, such as state, currently loaded and ready media, number of jobs at the Printer, errors,
448 warnings, and so forth, is directly associated with the Printer object itself rather than with the entry in the
449 directory which only represents the Printer object.

450 IPP clients implement the IPP protocol on the client side and give end users (or programs running on behalf
451 of end users) the ability to query Printer objects and submit and manage print jobs. An IPP server is just
452 that part of the Printer object that implements the server-side protocol. The rest of the Printer object
453 implements (or gateways into) the application semantics of the print service itself. The Printer objects may
454 be embedded in an output device or may be implemented on a host on the network that communicates with
455 an output device.

456 When a job is submitted to the Printer object and the Printer object validates the attributes in the
457 submission request, the Printer object creates a new Job object. The end user then interacts with this new
458 Job object to query its status and monitor the progress of the job. An end user can also cancel their print
459 jobs by using the Job object's Cancel-Job operation. An end-user can also hold, release, and restart their
460 print jobs using the Job object's OPTIONAL Hold-Job, Release-Job, and Restart-Job operations, if
461 implemented.

462 A privileged operator or administrator of a Printer object can cancel, hold, release, and restart any user's job
463 using the REQUIRED Cancel-Job and the OPTIONAL Hold-Job, Release-Job, and Restart-Job operations.
464 In addition, a privileged operator or administrator of a Printer object can pause, resume, or purge (jobs from)
465 a Printer object using the OPTIONAL Pause-Printer, Resume-Printer, and Purge-Jobs operations, if
466 implemented.

467 The notification service is out of scope for this IPP/1.1 document, but using such a notification service, the
468 end user is able to register for and receive Printer specific and Job specific events. An end user can query
469 the status of Printer objects and can follow the progress of Job objects by polling using the Get-Printer-
470 Attributes, Get-Jobs, and Get-Job-Attributes operations.

471 2. IPP Objects

472 The IPP/1.1 model introduces objects of type Printer and Job. Each type of object models relevant aspects
473 of a real-world entity such as a real printer or real print job. Each object type is defined as a set of possible
474 attributes that may be supported by instances of that object type. For each object (instance), the actual set
475 of supported attributes and values describe a specific implementation. The object's attributes and values
476 describe its state, capabilities, realizable features, job processing functions, and default behaviors and
477 characteristics. For example, the Printer object type is defined as a set of attributes that each Printer object
478 potentially supports. In the same manner, the Job object type is defined as a set of attributes that are
479 potentially supported by each Job object.

480 Each attribute included in the set of attributes defining an object type is labeled as:

- 481 - "REQUIRED": each object MUST support the attribute.
 - 482 - "RECOMMENDED": each object SHOULD support the attribute.
 - 483 - "OPTIONAL": each object MAY support the attribute.
- 484

485 Some definitions of attribute values indicate that an object MUST or SHOULD support the value;
486 otherwise, support of the value is OPTIONAL. However, if an implementation supports an attribute, it
487 MUST support at least one of the possible values for that attribute.

488 2.1 Printer Object

489 The major component of the IPP/1.1 model is the Printer object. A Printer object implements the server-
490 side of the IPP/1.1 protocol. Using the protocol, end users may query the attributes of the Printer object and
491 submit print jobs to the Printer object. The actual implementation components behind the Printer

492 abstraction may take on different forms and different configurations. However, the model abstraction
493 allows the details of the configuration of real components to remain opaque to the end user. Section 3
494 describes each of the Printer operations in detail.

495 The capabilities and state of a Printer object are described by its attributes. Printer attributes are divided
496 into two groups:

- 497 - "job-template" attributes: These attributes describe supported job processing capabilities and defaults
- 498 for the Printer object. (See section 4.2)
- 499 - "printer-description" attributes: These attributes describe the Printer object's identification, state,
- 500 location, references to other sources of information about the Printer object, etc. (see section 4.4)

501

502 Since a Printer object is an abstraction of a generic document output device and print service provider, a
503 Printer object could be used to represent any real or virtual device with semantics consistent with the
504 Printer object, such as a fax device, an imager, or even a CD writer.

505 Some examples of configurations supporting a Printer object include:

- 506 1) An output device with no spooling capabilities
- 507 2) An output device with a built-in spooler
- 508 3) A print server supporting IPP with one or more associated output devices
- 509 3a) The associated output devices may or may not be capable of spooling jobs
- 510 3b) The associated output devices may or may not support IPP

511

512 The following figures show some examples of how Printer objects can be realized on top of various
513 distributed printing configurations. The embedded case below represents configurations 1 and 2. The
514 hosted and fan-out figures below represent configurations 3a and 3b.

515 In this document the term "client" refers to a software entity that sends IPP operation requests to an IPP
516 Printer object and accepts IPP operation responses. A client MAY be:

- 517 1. contained within software controlled by an end user, e.g. activated by the "Print" menu item in an
518 application or
- 519 2. the print server component that sends IPP requests to either an output device or another
520 "downstream" print server.

521 The term "IPP Printer" is a network entity that accepts IPP operation requests and returns IPP operation
522 responses. As such, an IPP object MAY be:

- 523 1. an (embedded) device component that accepts IPP requests and controls the device or
- 524 2. a component of a print server that accepts IPP requests (where the print server controls one or more
525 networked devices using IPP or other protocols). **Issue 4**

569

570 2.2 Job Object

571 A Job object is used to model a print job. A Job object contains documents. The information required to
572 create a Job object is sent in a create request from the end user via an IPP Client to the Printer object. The

573 Printer object validates the create request, and if the Printer object accepts the request, the Printer object
574 creates the new Job object. Section 3 describes each of the Job operations in detail.

575 The characteristics and state of a Job object are described by its attributes. Job attributes are grouped into
576 two groups as follows:

- 577 - "job-template" attributes: These attributes can be supplied by the client or end user and include job
578 processing instructions which are intended to override any Printer object defaults and/or instructions
579 embedded within the document data. (See section 4.2)
- 580 - "job-description" attributes: These attributes describe the Job object's identification, state, size, etc.
581 The client supplies some of these attributes, and the Printer object generates others. (See section 4.3)

582

583 An implementation **MUST** support at least one document per Job object. An implementation **MAY** support
584 multiple documents per Job object. A document is either:

- 585 - a stream of document data in a format supported by the Printer object (typically a Page Description
586 Language - PDL), or
- 587 - a reference to such a stream of document data

588

589 In IPP/1.1, a document is not modeled as an IPP object, therefore it has no object identifier or associated
590 attributes. All job processing instructions are modeled as Job object attributes. These attributes are called
591 Job Template attributes and they apply equally to all documents within a Job object.

592 2.3 Object Relationships

593 IPP objects have relationships that are maintained persistently along with the persistent storage of the object
594 attributes.

595 A Printer object can represent either one or more physical output devices or a logical device which
596 "processes" jobs but never actually uses a physical output device to put marks on paper. Examples of
597 logical devices include a Web page publisher or a gateway into an online document archive or repository.
598 A Printer object contains zero or more Job objects.

599 A Job object is contained by exactly one Printer object, however the identical document data associated
600 with a Job object could be sent to either the same or a different Printer object. In this case, a second Job
601 object would be created which would be almost identical to the first Job object, however it would have new
602 (different) Job object identifiers (see section 2.4).

603 A Job object is either empty (before any documents have been added) or contains one or more documents.
604 If the contained document is a stream of document data, that stream can be contained in only one document.
605 However, there can be identical copies of the stream in other documents in the same or different Job
606 objects. If the contained document is just a reference to a stream of document data, other documents (in the
607 same or different Job object(s)) may contain the same reference.

608 2.4 Object Identity

609 All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [RFC2396] so that they
610 can be persistently and unambiguously referenced. The notion of a URI is a useful concept, however, until
611 the notion of URI is more stable (i.e., defined more completely and deployed more widely), it is expected
612 that the URIs used for IPP objects will actually be URLs [RFC2396]. Since every URL is a specialized
613 form of a URI, even though the more generic term URI is used throughout the rest of this document, its
614 usage is intended to cover the more specific notion of URL as well.

615 An administrator configures Printer objects to either support or not support authentication and/or message
616 privacy using Transport Layer Security (TLS) [RFC2246] (the mechanism for security configuration is
617 outside the scope of this IPP/1.1 document). In some situations, both types of connections (both
618 authenticated and unauthenticated) can be established using a single communication channel that has some
619 sort of negotiation mechanism. In other situations, multiple communication channels are used, one for each
620 type of security configuration. Section 8 provides a full description of all security considerations and
621 configurations.

622 If a Printer object supports more than one communication channel, some or all of those channels might
623 support and/or require different security mechanisms. In such cases, an administrator could expose the
624 simultaneous support for these multiple communication channels as multiple URIs for a single Printer
625 object where each URI represents one of the communication channels to the Printer object. To support this
626 flexibility, the IPP Printer object type defines a multi-valued identification attribute called the "printer-uri-
627 supported" attribute. It **MUST** contain at least one URI. It **MAY** contain more than one URI. That is,
628 every Printer object will have at least one URI that identifies at least one communication channel to the
629 Printer object, but it may have more than one URI where each URI identifies a different communication
630 channel to the Printer object. The "printer-uri-supported" attribute has two companion attributes, the "uri-
631 security-supported" attribute and the "uri-authentication-supported". Both have the same cardinality as
632 "printer-uri-supported". The purpose of the "uri-security-supported" attribute is to indicate the security
633 mechanisms (if any) used for each URI listed in "printer-uri-supported". The purpose of the "uri-
634 authentication-supported" attribute is to indicate the authentication mechanisms (if any) used for each URI
635 listed in "printer-uri-supported". These three attributes are fully described in sections 4.4.1, 4.4.2, and
636 4.4.3. **Issue 2**

637 When a job is submitted to the Printer object via a create request, the client supplies only a single Printer
638 object URI. The client supplied Printer object URI **MUST** be one of the values in the "printer-uri-
639 supported" Printer attribute.

640 IPP/1.1 does not specify how the client obtains the client supplied URI, but it is **RECOMMENDED** that a
641 Printer object be registered as an entry in a directory service. End-users and programs can then interrogate
642 the directory searching for Printers. Section 16 defines a generic schema for Printer object entries in the
643 directory service and describes how the entry acts as a bridge to the actual IPP Printer object. The entry in
644 the directory that represents the IPP Printer object includes the possibly many URIs for that Printer object as
645 values in one its attributes.

646 When a client submits a create request to the Printer object, the Printer object validates the request and
647 creates a new Job object. The Printer object assigns the new Job object a URI which is stored in the "job-

648 uri" Job attribute. This URI is then used by clients as the target for subsequent Job operations. The Printer
649 object generates a Job URI based on its configured security policy and the URI used by the client in the
650 create request.

651 For example, consider a Printer object that supports both a communication channel secured by the use of
652 SSL3 (using HTTP over SSL3 with an "https" schemed URI) and another open communication channel that
653 is not secured with SSL3 (using a simple "http" schemed URI). If a client were to submit a job using the
654 secure URI, the Printer object would assign the new Job object a secure URI as well. If a client were to
655 submit a job using the open-channel URI, the Printer would assign the new Job object an open-channel
656 URI.

657 In addition, the Printer object also populates the Job object's "job-printer-uri" attribute. This is a reference
658 back to the Printer object that created the Job object. If a client only has access to a Job object's "job-uri"
659 identifier, the client can query the Job's "job-printer-uri" attribute in order to determine which Printer object
660 created the Job object. If the Printer object supports more than one URI, the Printer object picks the one
661 URI supplied by the client when creating the job to build the value for and to populate the Job's "job-
662 printer-uri" attribute.

663 Allowing Job objects to have URIs allows for flexibility and scalability. For example, in some
664 implementations, the Printer object might create Jobs that are processed in the same local environment as
665 the Printer object itself. In this case, the Job URI might just be a composition of the Printer's URI and some
666 unique component for the Job object, such as the unique 32-bit positive integer mentioned later in this
667 paragraph. In other implementations, the Printer object might be a central clearing-house for validating all
668 Job object creation requests, but the Job object itself might be created in some environment that is remote
669 from the Printer object. In this case, the Job object's URI may have no physical-location relationship at all
670 to the Printer object's URI. Again, the fact that Job objects have URIs allows for flexibility and scalability,
671 however, many existing printing systems have local models or interface constraints that force print jobs to
672 be identified using only a 32-bit positive integer rather than an independent URI. This numeric Job ID is
673 only unique within the context of the Printer object to which the create request was originally submitted.
674 Therefore, in order to allow both types of client access to IPP Job objects (either by Job URI or by numeric
675 Job ID), when the Printer object successfully processes a create request and creates a new Job object, the
676 Printer object MUST generate both a Job URI and a Job ID. The Job ID (stored in the "job-id" attribute)
677 only has meaning in the context of the Printer object to which the create request was originally submitted.
678 This requirement to support both Job URIs and Job IDs allows all types of clients to access Printer objects
679 and Job objects no matter the local constraints imposed on the client implementation.

680 In addition to identifiers, Printer objects and Job objects have names ("printer-name" and "job-name"). An
681 object name NEED NOT be unique across all instances of all objects. A Printer object's name is chosen and
682 set by an administrator through some mechanism outside the scope of this IPP/1.1 document. A Job
683 object's name is optionally chosen and supplied by the IPP client submitting the job. If the client does not
684 supply a Job object name, the Printer object generates a name for the new Job object. In all cases, the name
685 only has local meaning.

686 To summarize:

- 687 - Each Printer object is identified with one or more URIs. The Printer's "printer-uri-supported" attribute
688 contains the URI(s).

- 689 - The Printer object's "uri-security-supported" attribute identifies the communication channel security
690 protocols that may or may not have been configured for the various Printer object URIs (e.g., 'tls' or
691 'none').
- 692 - The Printer object's "uri-authentication-supported" attribute identifies the authentication mechanisms
693 that may or may not have been configured for the various Printer object URIs (e.g., 'digest' or
694 'none').
- 695 - Each Job object is identified with a Job URI. The Job's "job-uri" attribute contains the URI.
- 696 - Each Job object is also identified with Job ID which is a 32-bit, positive integer. The Job's "job-id"
697 attribute contains the Job ID. The Job ID is only unique within the context of the Printer object
698 which created the Job object.
- 699 - Each Job object has a "job-printer-uri" attribute which contains the URI of the Printer object that was
700 used to create the Job object. This attribute is used to determine the Printer object that created a Job
701 object when given only the URI for the Job object. This linkage is necessary to determine the
702 languages, charsets, and operations which are supported on that Job (the basis for such support
703 comes from the creating Printer object).
- 704 - Each Printer object has a name (which is not necessarily unique). The administrator chooses and sets
705 this name through some mechanism outside the scope of this IPP/1.1 document. The Printer object's
706 "printer-name" attribute contains the name.
- 707 - Each Job object has a name (which is not necessarily unique). The client optionally supplies this name
708 in the create request. If the client does not supply this name, the Printer object generates a name for
709 the Job object. The Job object's "job-name" attribute contains the name.

710 3. IPP Operations

711 IPP objects support operations. An operation consists of a request and a response. When a client
712 communicates with an IPP object, the client issues an operation request to the URI for that object.
713 Operation requests and responses have parameters that identify the operation. Operations also have
714 attributes that affect the run-time characteristics of the operation (the intended target, localization
715 information, etc.). These operation-specific attributes are called operation attributes (as compared to object
716 attributes such as Printer object attributes or Job object attributes). Each request carries along with it any
717 operation attributes, object attributes, and/or document data required to perform the operation. Each
718 request requires a response from the object. Each response indicates success or failure of the operation with
719 a status code as a response parameter. The response contains any operation attributes, object attributes,
720 and/or status messages generated during the execution of the operation request.

721 This section describes the semantics of the IPP operations, both requests and responses, in terms of the
722 parameters, attributes, and other data associated with each operation.

723 The IPP/1.1 Printer operations are:

- 724 Print-Job (section 3.2.1)
- 725 Print-URI (section 3.2.2)
- 726 Validate-Job (section 3.2.3)
- 727 Create-Job (section 3.2.4)
- 728 Get-Printer-Attributes (section 3.2.5)

729 Get-Jobs (section 3.2.6)
730 Pause-Printer (section 3.3.5)
731 Resume-Printer (section 3.3.6)
732 Purge-Jobs (section 3.3.7)
733

734 The Job operations are:

735 Send-Document (section 3.3.1)
736 Send-URI (section 3.3.2)
737 Cancel-Job (section 3.3.3)
738 Get-Job-Attributes (section 3.3.4)
739 Hold-Job (section 3.3.5)
740 Release-Job (section 3.3.6)
741 Restart-Job (section 3.3.7)
742

743 The Send-Document and Send-URI Job operations are used to add a new document to an existing multi-
744 document Job object created using the Create-Job operation.

745 3.1 Common Semantics

746 All IPP operations require some common parameters and operation attributes. These common elements
747 and their semantic characteristics are defined and described in more detail in the following sections.

748 3.1.1 Required Parameters

749 Every operation request contains the following REQUIRED parameters:

- 750 - a "version-number",
 - 751 - an "operation-id",
 - 752 - a "request-id", and
 - 753 - the attributes that are REQUIRED for that type of request.
- 754

755 Every operation response contains the following REQUIRED parameters:

- 756 - a "version-number",
 - 757 - a "status-code",
 - 758 - the "request-id" that was supplied in the corresponding request, and
 - 759 - the attributes that are REQUIRED for that type of response.
- 760

761 The "Encoding and Transport document [IPP-PRO] defines special rules for the encoding of these
762 parameters. All other operation elements are represented using the more generic encoding rules for
763 attributes and groups of attributes.

764 3.1.2 Operation IDs and Request IDs

765 Each IPP operation request includes an identifying "operation-id" value. Valid values are defined in the
766 "operations-supported" Printer attribute section (see section 4.4.15). The client specifies which operation is
767 being requested by supplying the correct "operation-id" value.

768 In addition, every invocation of an operation is identified by a "request-id" value. For each request, the
769 client chooses the "request-id" which MUST be an integer (possibly unique depending on client
770 requirements) in the range from 1 to $2^{31} - 1$ (inclusive). This "request-id" allows clients to manage
771 multiple outstanding requests. The receiving IPP object copies all 32-bits of the client-supplied "request-id"
772 attribute into the response so that the client can match the response with the correct outstanding request,
773 even if the "request-id" is out of range. If the request is terminated before the complete "request-id" is
774 received, the IPP object rejects the request and returns a response with a "request-id" of 0.

775 Note: In some cases, the transport protocol underneath IPP might be a connection oriented protocol that
776 would make it impossible for a client to receive responses in any order other than the order in which the
777 corresponding requests were sent. In such cases, the "request-id" attribute would not be essential for correct
778 protocol operation. However, in other mappings, the operation responses can come back in any order. In
779 these cases, the "request-id" would be essential.

780 3.1.3 Attributes

781 Operation requests and responses are both composed of groups of attributes and/or document data. The
782 attributes groups are:

- 783 - Operation Attributes: These attributes are passed in the operation and affect the IPP object's behavior
784 while processing the operation request and may affect other attributes or groups of attributes. Some
785 operation attributes describe the document data associated with the print job and are associated with
786 new Job objects, however most operation attributes do not persist beyond the life of the operation.
787 The description of each operation attribute includes conformance statements indicating which
788 operation attributes are REQUIRED and which are OPTIONAL for an IPP object to support and
789 which attributes a client MUST supply in a request and an IPP object MUST supply in a response.
- 790 - Job Template Attributes: These attributes affect the processing of a job. A client OPTIONALLY
791 supplies Job Template Attributes in a create request, and the receiving object MUST be prepared to
792 receive all supported attributes. The Job object can later be queried to find out what Job Template
793 attributes were originally requested in the create request, and such attributes are returned in the
794 response as Job Object Attributes. The Printer object can be queried about its Job Template
795 attributes to find out what type of job processing capabilities are supported and/or what the default
796 job processing behaviors are, though such attributes are returned in the response as Printer Object
797 Attributes. The "ipp-attribute-fidelity" operation attribute affects processing of all client-supplied
798 Job Template attributes (see sections 3.2.1.2 and 15 for a full description of "ipp-attribute-fidelity"
799 and its relationship to other attributes).
- 800 - Job Object Attributes: These attributes are returned in response to a query operation directed at a Job
801 object.
- 802 - Printer Object Attributes: These attributes are returned in response to a query operation directed at a
803 Printer object.

804 - Unsupported Attributes: In a create request, the client supplies a set of Operation and Job Template
805 attributes. If any of these attributes or their values is unsupported by the Printer object, the Printer
806 object returns the set of unsupported attributes in the response. Sections 3.1.7, 3.2.1.2, and 15 give
807 a full description of how Job Template attributes supplied by the client in a create request are
808 processed by the Printer object and how unsupported attributes are returned to the client. Because
809 of extensibility, any IPP object might receive a request that contains new or unknown attributes or
810 values for which it has no support. In such cases, the IPP object processes what it can and returns
811 the unsupported attributes in the response. The Unsupported Attribute group is defined for all
812 operation responses for returning unsupported attributes that the client supplied in the request.
813

814 Later in this section, each operation is formally defined by identifying the allowed and expected groups of
815 attributes for each request and response. The model identifies a specific order for each group in each
816 request or response, but the attributes within each group may be in any order, unless specified otherwise.

817 Each attribute definition includes the attribute's name followed by the name of its attribute syntax(es) in
818 parentheses. In addition, each 'integer' attribute is followed by the allowed range in parentheses, (m:n),
819 for values of that attribute. Each 'text' or 'name' attribute is followed by the maximum size in octets in
820 parentheses, (size), for values of that attribute. For more details on attribute syntax notation, see the
821 descriptions of these attributes syntaxes in section 4.1.

822 Note: Document data included in the operation is not strictly an attribute, but it is treated as a special
823 attribute group for ordering purposes. The only operations that support supplying the document data within
824 an operation request are Print-Job and Send-Document. There are no operation responses that include
825 document data.

826 Some operations are REQUIRED for IPP objects to support; the others are OPTIONAL (see section 5.2.2).
827 Therefore, before using an OPTIONAL operation, a client SHOULD first use the REQUIRED Get-Printer-
828 Attributes operation to query the Printer's "operations-supported" attribute in order to determine which
829 OPTIONAL Printer and Job operations are actually supported. The client SHOULD NOT use an
830 OPTIONAL operation that is not supported. When an IPP object receives a request to perform an operation
831 it does not support, it returns the 'server-error-operation-not-supported' status code (see section 13.1.5.2).
832 An IPP object is non-conformant if it does not support a REQUIRED operation.

833 3.1.4 Character Set and Natural Language Operation Attributes

834 Some Job and Printer attributes have values that are text strings and names intended for human
835 understanding rather than machine understanding (see the 'text' and 'name' attribute syntax descriptions in
836 section 4.1). The following sections describe two special Operation Attributes called "attributes-charset"
837 and "attributes-natural-language". These attributes are always part of the Operation Attributes group. For
838 most attribute groups, the order of the attributes within the group is not important. However, for these two
839 attributes within the Operation Attributes group, the order is critical. The "attributes-charset" attribute
840 MUST be the first attribute in the group and the "attributes-natural-language" attribute MUST be the second
841 attribute in the group. In other words, these attributes MUST be supplied in every IPP request and
842 response, they MUST come first in the group, and MUST come in the specified order. For job creation
843 operations, the IPP Printer implementation saves these two attributes with the new Job object as Job

844 Description attributes. For the sake of brevity in this document, these operation attribute descriptions are
845 not repeated with every operation request and response, but have a reference back to this section instead.

846 3.1.4.1 Request Operation Attributes

847 The client **MUST** supply and the Printer object **MUST** support the following **REQUIRED** operation
848 attributes in every IPP/1.1 operation request:

849 "attributes-charset" (charset):

850 This operation attribute identifies the charset (coded character set and encoding method) used by
851 any 'text' and 'name' attributes that the client is supplying in this request. It also identifies the
852 charset that the Printer object **MUST** use (if supported) for all 'text' and 'name' attributes and status
853 messages that the Printer object returns in the response to this request. See Sections 4.1.1 and 4.1.2
854 for the definition of the 'text' and 'name' attribute syntaxes.

855
856 All clients and IPP objects **MUST** support the 'utf-8' charset [RFC2279] and **MAY** support
857 additional charsets provided that they are registered with IANA [IANA-CS]. If the Printer object
858 does not support the client supplied charset value, the Printer object **MUST** reject the request, set
859 the "attributes-charset" to 'utf-8' in the response, and return the 'client-error-charset-not-supported'
860 status code and any 'text' or 'name' attributes using the 'utf-8' charset. The Printer **NEED NOT** return
861 any attributes in the Unsupported Attributes Group (See sections 3.1.7 and 3.2.1.2). The Printer
862 object **MUST** indicate the charset(s) supported as the values of the "charset-supported" Printer
863 attribute (see Section 4.4.18), so that the client can query to determine which charset(s) are
864 supported.

865
866 Note to client implementers: Since IPP objects are only required to support the 'utf-8' charset, in
867 order to maximize interoperability with multiple IPP object implementations, a client may want to
868 supply 'utf-8' in the "attributes-charset" operation attribute, even though the client is only passing
869 and able to present a simpler charset, such as US-ASCII or ISO-8859-1. Then the client will have to
870 filter out (or charset convert) those characters that are returned in the response that it cannot present
871 to its user. On the other hand, if both the client and the IPP objects also support a charset in
872 common besides utf-8, the client may want to use that charset in order to avoid charset conversion
873 or data loss.

874
875 See the 'charset' attribute syntax description in Section 4.1.7 for the syntax and semantic
876 interpretation of the values of this attribute and for example values.

877
878 "attributes-natural-language" (naturalLanguage):

879 This operation attribute identifies the natural language used by any 'text' and 'name' attributes that
880 the client is supplying in this request. This attribute also identifies the natural language that the
881 Printer object **SHOULD** use for all 'text' and 'name' attributes and status messages that the Printer
882 object returns in the response to this request.

883
884 There are no **REQUIRED** natural languages required for the Printer object to support. However, the
885 Printer object's "generated-natural-language-supported" attribute identifies the natural languages
886 supported by the Printer object and any contained Job objects for all text strings generated by the

887 IPP object. A client MAY query this attribute to determine which natural language(s) are supported
888 for generated messages.

889

890 For any of the attributes for which the Printer object generates text, i.e., for the "job-state-message",
891 "printer-state-message", and status messages (see Section 3.1.6), the Printer object MUST be able to
892 generate these text strings in any of its supported natural languages. If the client requests a natural
893 language that is not supported, the Printer object MUST return these generated messages in the
894 Printer's configured natural language as specified by the Printer's "natural-language-configured"
895 attribute" (see Section 4.4.19).

896

897 For other 'text' and 'name' attributes supplied by the client, authentication system, operator, system
898 administrator, or manufacturer (i.e., for "job-originating-user-name", "printer-name" (name),
899 "printer-location" (text), "printer-info" (text), and "printer-make-and-model" (text)), the Printer
900 object is only required to support the configured natural language of the Printer identified by the
901 Printer object's "natural-language-configured" attribute, though support of additional natural
902 languages for these attributes is permitted.

903

904 For any 'text' or 'name' attribute in the request that is in a different natural language than the value
905 supplied in the "attributes-natural-language" operation attribute, the client MUST use the Natural
906 Language Override mechanism (see sections 4.1.1.2 and 4.1.2.2) for each such attribute value
907 supplied. The client MAY use the Natural Language Override mechanism redundantly, i.e., use it
908 even when the value is in the same natural language as the value supplied in the "attributes-natural-
909 language" operation attribute of the request.

910

911 The IPP object MUST accept any natural language and any Natural Language Override, whether the
912 IPP object supports that natural language or not (and independent of the value of the "ipp-attribute-
913 fidelity" Operation attribute). That is the IPP object accepts all client supplied values no matter
914 what the values are in the Printer object's "generated-natural-language-supported" attribute. That
915 attribute, "generated-natural-language-supported", only applies to generated messages, not client
916 supplied messages. The IPP object MUST remember that natural language for all client-supplied
917 attributes, and when returning those attributes in response to a query, the IPP object MUST indicate
918 that natural language.

919

920 Each value whose attribute syntax type is 'text' or 'name' (see sections 4.1.1 and 4.1.2) has an
921 Associated Natural-Language. This document does not specify how this association is stored in a
922 Printer or Job object. When such a value is encoded in a request or response, the natural language is
923 either implicit or explicit:

924

- 925 – In the implicit case, the value contains only the text/name value, and the language is
926 specified by the "attributes-natural-language" operation attribute in the request or response
927 (see sections 4.1.1.1 textWithoutLanguage and 4.1.2.1 nameWithoutLanguage).
- 928 – In the explicit case (also known as the Natural-Language Override case), the value contains
929 both the language and the text/name value (see sections 4.1.1.2 textWithLanguage and
930 4.1.2.2 nameWithLanguage).
- 931

932
933
934
935
936
937
938
939
940
941
942
943
944
945
946
947
948
949

For example, the "job-name" attribute MAY be supplied by the client in a create request. The text value for this attribute will be in the natural language identified by the "attribute-natural-language" attribute, or if different, as identified by the Natural Language Override mechanism. If supplied, the IPP object will use the value of the "job-name" attribute to populate the Job object's "job-name" attribute. Whenever any client queries the Job object's "job-name" attribute, the IPP object returns the attribute as stored and uses the Natural Language Override mechanism to specify the natural language, if it is different from that reported in the "attributes-natural-language" operation attribute of the response. The IPP object MAY use the Natural Language Override mechanism redundantly, i.e., use it even when the value is in the same natural language as the value supplied in the "attributes-natural-language" operation attribute of the response.

An IPP object MUST NOT reject a request based on a supplied natural language in an "attributes-natural-language" Operation attribute or in any attribute that uses the Natural Language Override.

See the 'naturalLanguage' attribute syntax description in section 4.1.8 for the syntax and semantic interpretation of the values of this attribute and for example values.

950
951
952
953
954
955

Clients SHOULD NOT supply 'text' or 'name' attributes that use an illegal combination of natural language and charset. For example, suppose a Printer object supports charsets 'utf-8', 'iso-8859-1', and 'iso-8859-7'. Suppose also, that it supports natural languages 'en' (English), 'fr' (French), and 'el' (Greek). Although the Printer object supports the charset 'iso-8859-1' and natural language 'el', it probably does not support the combination of Greek text strings using the 'iso-8859-1' charset. The Printer object handles this apparent incompatibility differently depending on the context in which it occurs:

956
957
958
959
960
961
962
963
964

- In a create request: If the client supplies a text or name attribute (for example, the "job-name" operation attribute) that uses an apparently incompatible combination, it is a client choice that does not affect the Printer object or its correct operation. Therefore, the Printer object simply accepts the client supplied value, stores it with the Job object, and responds back with the same combination whenever the client (or any client) queries for that attribute.
- In a query-type operation, like Get-Printer-Attributes: If the client requests an apparently incompatible combination, the Printer object responds (as described in section 3.1.4.2) using the Printer's configured natural language rather than the natural language requested by the client.

965
966
967
968
969

In either case, the Printer object does not reject the request because of the apparent incompatibility. The potential incompatible combination of charset and natural language can occur either at the global operation level or at the Natural Language Override attribute-by-attribute level. In addition, since the response always includes explicit charset and natural language information, there is never any question or ambiguity in how the client interprets the response.

970

3.1.4.2 Response Operation Attributes

971
972

The Printer object MUST supply and the client MUST support the following REQUIRED operation attributes in every IPP/1.1 operation response:

973 "attributes-charset" (charset):

974 This operation attribute identifies the charset used by any 'text' and 'name' attributes that the Printer
975 object is returning in this response. The value in this response **MUST** be the same value as the
976 "attributes-charset" operation attribute supplied by the client in the request. If this is not possible
977 (i.e., the charset requested is not supported), the request would have been rejected. See "attributes-
978 charset" described in Section 3.1.4.1 above.

979
980 If the Printer object supports more than just the 'utf-8' charset, the Printer object **MUST** be able to
981 code convert between each of the charsets supported on a highest fidelity possible basis in order to
982 return the 'text' and 'name' attributes in the charset requested by the client. However, some
983 information loss **MAY** occur during the charset conversion depending on the charsets involved. For
984 example, the Printer object may convert from a UTF-8 'a' to a US-ASCII 'a' (with no loss of
985 information), from an ISO Latin 1 CAPITAL LETTER A WITH ACUTE ACCENT to US-ASCII
986 'A' (losing the accent), or from a UTF-8 Japanese Kanji character to some ISO Latin 1 error
987 character indication such as '?', decimal code equivalent, or to the absence of a character, depending
988 on implementation.

989
990 Whether an implementation that supports more than one charset stores the data in the charset
991 supplied by the client or code converts to one of the other supported charsets, depends on
992 implementation. The strategy should try to minimize loss of information during code conversion.
993 On each response, such an implementation converts from its internal charset to that requested.

994
995 "attributes-natural-language" (naturalLanguage):

996 This operation attribute identifies the natural language used by any 'text' and 'name' attributes that
997 the IPP object is returning in this response. Unlike the "attributes-charset" operation attribute, the
998 IPP object **NEED NOT** return the same value as that supplied by the client in the request. The IPP
999 object **MAY** return the natural language of the Job object or the Printer's configured natural
1000 language as identified by the Printer object's "natural-language-configured" attribute, rather than the
1001 natural language supplied by the client. For any 'text' or 'name' attribute or status message in the
1002 response that is in a different natural language than the value returned in the "attributes-natural-
1003 language" operation attribute, the IPP object **MUST** use the Natural Language Override mechanism
1004 (see sections 4.1.1.2 and 4.1.2.2) on each attribute value returned. The IPP object **MAY** use the
1005 Natural Language Override mechanism redundantly, i.e., use it even when the value is in the same
1006 natural language as the value supplied in the "attributes-natural-language" operation attribute of the
1007 response.

1008 3.1.5 Operation Targets

1009 All IPP operations are directed at IPP objects. For Printer operations, the operation is always directed at a
1010 Printer object using one of its URIs (i.e., one of the values in the Printer object's "printer-uri-supported"
1011 attribute). Even if the Printer object supports more than one URI, the client supplies only one URI as the
1012 target of the operation. The client identifies the target object by supplying the correct URI in the "printer-
1013 uri (uri)" operation attribute.

1014 For Job operations, the operation is directed at either:

- 1015 - The Job object itself using the Job object's URI. In this case, the client identifies the target object by
1016 supplying the correct URI in the "job-uri (uri)" operation attribute.
- 1017 - The Printer object that created the Job object using both the Printer objects URI and the Job object's
1018 Job ID. Since the Printer object that created the Job object generated the Job ID, it **MUST** be able to
1019 correctly associate the client supplied Job ID with the correct Job object. The client supplies the
1020 Printer object's URI in the "printer-uri (uri)" operation attribute and the Job object's Job ID in the
1021 "job-id (integer(1:MAX))" operation attribute.

1022

1023 If the operation is directed at the Job object directly using the Job object's URI, the client **MUST NOT**
1024 include the redundant "job-id" operation attribute.

1025 The operation target attributes are **REQUIRED** operation attributes that **MUST** be included in every
1026 operation request. Like the charset and natural language attributes (see section 3.1.4), the operation target
1027 attributes are specially ordered operation attributes. In all cases, the operation target attributes immediately
1028 follow the "attributes-charset" and "attributes-natural-language" attributes within the operation attribute
1029 group, however the specific ordering rules are:

- 1030 - In the case where there is only one operation target attribute (i.e., either only the "printer-uri" attribute
1031 or only the "job-uri" attribute), that attribute **MUST** be the third attribute in the operation attributes
1032 group.
- 1033 - In the case where Job operations use two operation target attributes (i.e., the "printer-uri" and "job-id"
1034 attributes), the "printer-uri" attribute **MUST** be the third attribute and the "job-id" attribute **MUST**
1035 be the fourth attribute.

1036

1037 In all cases, the target URIs contained within the body of IPP operation requests and responses must be in
1038 absolute format rather than relative format (a relative URL identifies a resource with the scope of the HTTP
1039 server, but does not include scheme, host or port).

1040 The following rules apply to the use of port numbers in URIs that identify IPP objects:

- 1041 1. If the URI scheme allows the port number to be explicitly included in the URI string, and a port
1042 number is specified within the URI, then that port number **MUST** be used by the client to contact
1043 the IPP object.
- 1044
- 1045 2. If the URI scheme allows the port number to be explicitly included in the URI string, and a port
1046 number is not specified within the URI, then default port number implied by that URI scheme
1047 **MUST** be used by the client to contact the IPP object.
- 1048
- 1049 3. If the URI scheme does not allow an explicit port number to be specified within the URI, then the
1050 default port number implied by that URI **MUST** be used by the client to contact the IPP object.

1051

1052 Note: The IPP "Encoding and Transport document [IPP-PRO] shows a mapping of IPP onto HTTP/1.1 and
1053 defines a new default port number for using IPP over HTTP/1.1.

1054 3.1.6 Operation Response Status Codes and Status Messages

1055 Every operation response includes a REQUIRED "status-code" parameter and an OPTIONAL "status-
 1056 message" operation attribute, and an OPTIONAL "detailed-status-message" operation attribute. The Print-
 1057 URI and Send-URI response MAY include an OPTIONAL "document-access-error" operation attribute.

1058 3.1.6.1 "status-code" (type2 enum)

1059 The REQUIRED "status-code" parameter provides information on the processing of a request.

1060 The status code is intended for use by automata. A client implementation of IPP SHOULD convert status
 1061 code values into any localized message that has semantic meaning to the end user.

1062 The "status-code" value is a numeric value that has semantic meaning. The "status-code" syntax is similar
 1063 to a "type2 enum" (see section 4.1 on "Attribute Syntaxes") except that values can range only from 0x0000
 1064 to 0x7FFF. Section 13 describes the status codes, assigns the numeric values, and suggests a corresponding
 1065 status message for each status code for use by the client when the user's natural language is English.

1066 If the Printer performs an operation with no errors and it encounters no problems, it MUST return the status
 1067 code 'successful-ok' in the response. See section 13.

1068 If the client supplies unsupported values for the following parameters or Operation attributes, the Printer
 1069 object MUST reject the operation, NEED NOT return the unsupported attribute value in the Unsupported
 1070 Attributes group, and MUST return the indicated status code:

Parameter/Attribute	Status code
version-number	server-error-version-not-supported
operation-id	server-error-operation-not-supported
attributes-charset	client-error-charset-not-supported
compression	client-error-compression-not-supported
document-format	client-error-document-format-not-supported
document-uri	client-error-uri-scheme-not-supported, client-error-document-access-error

1071

1072 If the client supplies unsupported values for other attributes, or unsupported attributes, the Printer returns
 1073 the status code defined in section 3.1.7 on Unsupported Attributes. **Issue 18**

1074 3.1.6.2 "status-message" (text(255))

1075 The OPTIONAL "status-message" operation attribute provides a short textual description of the status of
 1076 the operation. The "status-message" attribute's syntax is "text(255)", so the maximum length is 255 octets
 1077 (see section 4.1.1). The status message is intended for the human end user. If a response does include a
 1078 "status-message" attribute, an IPP client NEED NOT examine or display the messages, however it
 1079 SHOULD do so in some implementation specific manner. The "status-message" is especially useful for a
 1080 later version of a Printer object to return as supplemental information for the human user to accompany a
 1081 status code that an earlier version of a client might not understand.

1082 If the Printer object supports the "status-message" operation attribute, the Printer object MUST be able to
1083 generate this message in any of the natural languages identified by the Printer object's "generated-natural-
1084 language-supported" attribute (see the "attributes-natural-language" operation attribute specified in section
1085 3.1.4.1. Section 13 suggests the text for the status message returned by the Printer for use with the English
1086 natural language.

1087 As described in section 3.1.4.1 for any returned 'text' attribute, if there is a choice for generating this
1088 message, the Printer object uses the natural language indicated by the value of the "attributes-natural-
1089 language" in the client request if supported, otherwise the Printer object uses the value in the Printer
1090 object's own "natural-language-configured" attribute.

1091 If the Printer object supports the "status-message" operation attribute, it SHOULD use the REQUIRED 'utf-
1092 8' charset to return a status message for the following error status codes (see section 13): 'client-error-bad-
1093 request', 'client-error-charset-not-supported', 'server-error-internal-error', 'server-error-operation-not-
1094 supported', and 'server-error-version-not-supported'. In this case, it MUST set the value of the "attributes-
1095 charset" operation attribute to 'utf-8' in the error response.

1096 3.1.6.3 "detailed-status-message" (text(MAX)) **Issue 35**

1097 The OPTIONAL "detailed-status-message" operation attribute provides additional more detailed technical
1098 and implementation-specific information about the operation. The "detailed-status-message" attribute's
1099 syntax is "text(MAX)", so the maximum length is 1023 octets (see section 4.1.1). If the Printer objects
1100 supports the "detailed-status-message" operation attribute, neither the Printer nor the client localizes the
1101 message, since it is intended for use by the system administrator or other experienced technical persons.
1102 Clients MUST NOT attempt to parse the value of this attribute. See the "document-access-error" operation
1103 attribute (section 3.1.6.4) for additional errors that a program can process.

1104 3.1.6.4 "document-access-error" (text(MAX)) **Issue 35**

1105 This OPTIONAL operation attribute provides additional information about any document access errors
1106 encountered by the Printer before it returned a response to the Print-URI (section 3.2.2) or Send-URI
1107 (section 3.3.1) operation. For errors in the protocol identified by the URI scheme in the "document-uri"
1108 operation attribute, such as 'http:' or 'ftp:', the error code is returned in parentheses, followed by the URI.
1109 For example:

```
1110     (404) http://ftp.pwg.org/pub/pwg/ipp/new_MOD/ipp-model-v11-990510.pdf  
1111
```

1112 Most Internet protocols use decimal error codes (unlike IPP), so the ASCII error code representation is in
1113 decimal.

1114 3.1.7 Unsupported Attributes

1115 The Unsupported Attributes group contains attributes that are not supported by the operation. This group is
1116 primarily for the job creation operations, but all operations can return this group.

1117 A Printer object **MUST** include an Unsupported Attributes group in a response if the status code is one of
1118 the following: 'successful-ok-ignored-or-substituted-attributes', 'successful-ok-conflicting-attributes', 'client-
1119 error-attributes-or-values-not-supported' or 'client-error-conflicting-attributes'.

1120 If the status code is one of the four specified in the preceding paragraph, the Unsupported Attributes group
1121 **MUST** contain all of those attributes and only those attributes that are:

- 1122 a. an Operation or Job Template attribute supplied in the request, and
- 1123 b. unsupported by the printer. See below for details on the three categories "unsupported" attributes.
1124 [Issue 18, Issue 23, and Issue 27](#)

1125 If the Printer object is not returning any Unsupported Attributes in the response, the Printer object
1126 **SHOULD** omit Group 2 rather than sending an empty group. However, a client **MUST** be able to accept an
1127 empty group.

1128 Unsupported attributes fall into three categories:

- 1129 1. The Printer object does not support the supplied attribute (no matter what the attribute syntax or
1130 value).
- 1131 2. The Printer object does support the attribute, but does not support some or all of the particular
1132 attribute syntaxes or values supplied by the client (i.e., the Printer object does not have those
1133 attribute syntaxes or values in its corresponding "xxx-supported" attribute).
- 1134 3. The Printer object does support the attributes and values supplied, but the particular values are in
1135 conflict with one another, because they violate a constraint, such as not being able to staple
1136 transparencies.

1137 In the case of an unsupported attribute name, the Printer object returns the client-supplied attribute with a
1138 substituted value of 'unsupported'. This value's syntax type is "out-of-band" and its encoding is defined by
1139 special rules for "out-of-band" values in the "Encoding and Transport" document [IPP-PRO]. Its value
1140 indicates no support for the attribute itself (see the beginning of section 4.1). [Issue 12](#)

1141 In the case of a supported attribute with one or more unsupported attribute syntaxes or values, the Printer
1142 object simply returns the client-supplied attribute with the unsupported attribute syntaxes or values as
1143 supplied by the client. This indicates support for the attribute, but no support for that particular attribute
1144 syntax or value. If the client supplies a multi-valued attribute with more than one value and the Printer
1145 object supports the attribute but only supports a subset of the client-supplied attribute syntaxes or values,
1146 the Printer object **MUST** return only those attribute syntaxes or values that are unsupported.

1147 In the case of two (or more) supported attribute values that are in conflict with one another (although each
1148 is supported independently, the values conflict when requested together within the same job), the Printer
1149 object **MUST** return all the values that it ignores or substitutes to resolve the conflict, but not any of the
1150 values that it is still using. The choice for exactly how to resolve the conflict is implementation dependent.
1151 See sections 3.2.1.2 and 15. See The Implementer's Guide [IPP-IIG] for an example.

1152 3.1.8 Versions

1153 Each operation request and response carries with it a "version-number" parameter. Each value of the
1154 "version-number" is in the form "X.Y" where X is the major version number and Y is the minor version
1155 number. By including a version number in the client request, it allows the client to identify which version
1156 of IPP it is interested in using, i.e., the version whose conformance requirements the client may be
1157 depending upon the Printer to meet.

1158 If the IPP object does not support that major version number supplied by the client, i.e., the major version
1159 field of the "version-number" parameter does not match any of the values of the Printer's "ipp-versions-
1160 supported" (see section 4.4.14), the object MUST respond with a status code of 'server-error-version-not-
1161 supported' along with the closest version number that is supported (see section 13.1.5.4). If the major
1162 version number is supported, but the minor version number is not, the IPP object SHOULD accept and
1163 attempt to perform the request (or reject the request if the operation is not supported), else it rejects the
1164 request and returns the 'server-error-version-not-supported' status code. In all cases, the IPP object MUST
1165 return the "version-number" that it supports that is closest to the version number supplied by the client in
1166 the request.

1167 There is no version negotiation per se. However, if after receiving a 'server-error-version-not-supported'
1168 status code from an IPP object, a client SHOULD try again with a different version number. A client MAY
1169 also determine the versions supported either from a directory that conforms to Appendix E (see section 16)
1170 or by querying the Printer object's "ipp-versions-supported" attribute (see section 4.4.14) to determine
1171 which versions are supported. **Issue 36**

1172 An IPP object implementation MUST support version '1.1', i.e., meet the conformance requirements for
1173 IPP/1.1 as specified in this document and [IPP-PRO]. An IPP object implementation SHOULD support
1174 version '1.0', i.e., meet the conformance requirements for IPP/1.0 [RFC2566 and RFC2565]. **Issue 36**

1175 There is only one notion of "version number" that covers both IPP Model and IPP Protocol changes. Thus
1176 the version number MUST change when introducing a new version of the Model and Semantics document
1177 (this document) or a new version of the "Encoding and Transport" document [IPP-PRO].

1178 Changes to the major version number of the Model and Semantics document indicate structural or syntactic
1179 changes that make it impossible for older version of IPP clients and Printer objects to correctly parse and
1180 correctly process the new or changed attributes, operations and responses. If the major version number
1181 changes, the minor version numbers is set to zero. As an example, adding the REQUIRED "ipp-attribute-
1182 fidelity" attribute to version '1.1' (if it had not been part of version '1.0'), would have required a change to
1183 the major version number, since an IPP/1.0 Printer would not have processed a request with the correct
1184 semantics that contained the "ipp-attribute-fidelity" attribute that it did not know about. Items that might
1185 affect the changing of the major version number include any changes to the Model and Semantics document
1186 (this document) or the "Encoding and Transport" document [IPP-PRO] itself, such as:

- 1187 - reordering of ordered attributes or attribute sets
- 1188 - changes to the syntax of existing attributes
- 1189 - adding REQUIRED (for an IPP object to support) operation attribute groups
- 1190 - adding values to existing REQUIRED operation attributes
- 1191 - adding REQUIRED operations

1192

1193 Changes to the minor version number indicate the addition of new features, attributes and attribute values
1194 that may not be understood by all IPP objects, but which can be ignored if not understood. Items that might
1195 affect the changing of the minor version number include any changes to the model objects and attributes but
1196 not the encoding and transport rules [IPP-PRO] (except adding attribute syntaxes). Examples of such
1197 changes are:

- 1198 - grouping all extensions not included in a previous version into a new version
- 1199 - adding new attribute values
- 1200 - adding new object attributes
- 1201 - adding OPTIONAL (for an IPP object to support) operation attributes (i.e., those attributes that an IPP
1202 object can ignore without confusing clients)
- 1203 - adding OPTIONAL (for an IPP object to support) operation attribute groups (i.e., those attributes that
1204 an IPP object can ignore without confusing clients)
- 1205 - adding new attribute syntaxes
- 1206 - adding OPTIONAL operations
- 1207 - changing Job Description attributes or Printer Description attributes from OPTIONAL to REQUIRED
1208 or vice versa.
- 1209 - adding OPTIONAL attribute syntaxes to an existing attribute. **Issue 33**

1210 The encoding of the "version-number" MUST NOT change over any version number (either major or
1211 minor). This rule guarantees that all future versions will be backwards compatible with all previous
1212 versions (at least for checking the "version-number"). In addition, any protocol elements (attributes, error
1213 codes, tags, etc.) that are not carried forward from one version to the next are deprecated so that they can
1214 never be reused with new semantics.

1215 Implementations that support a certain version NEED NOT support ALL previous versions. As each new
1216 version is defined (through the release of a new IPP specification document), that version will specify
1217 which previous versions MUST and which versions SHOULD be supported in compliant implementations.
1218 **Issue 36**

1219 3.1.9 Job Creation Operations

1220 In order to "submit a print job" and create a new Job object, a client issues a create request. A create
1221 request is any one of following three operation requests:

- 1222 - The Print-Job Request: A client that wants to submit a print job with only a single document uses the
1223 Print-Job operation. The operation allows for the client to "push" the document data to the Printer
1224 object by including the document data in the request itself.
1225
- 1226 - The Print-URI Request: A client that wants to submit a print job with only a single document (where
1227 the Printer object "pulls" the document data instead of the client "pushing" the data to the Printer
1228 object) uses the Print-URI operation. In this case, the client includes in the request only a URI
1229 reference to the document data (not the document data itself).
1230
- 1231 - The Create-Job Request: A client that wants to submit a print job with multiple documents uses the
1232 Create-Job operation. This operation is followed by an arbitrary number of Send-Document and/or

1233 Send-URI operations (each creating another document for the newly create Job object). The Send-
1234 Document operation includes the document data in the request (the client "pushes" the document
1235 data to the printer), and the Send-URI operation includes only a URI reference to the document data
1236 in the request (the Printer "pulls" the document data from the referenced location). The last Send-
1237 Document or Send-URI request for a given Job object includes a "last-document" operation attribute
1238 set to 'true' indicating that this is the last request.
1239

1240 Throughout this model document, the term "create request" is used to refer to any of these three operation
1241 requests.

1242 A Create-Job operation followed by only one Send-Document operation is semantically equivalent to a
1243 Print-Job operation, however, for performance reasons, the client SHOULD use the Print-Job operation for
1244 all single document jobs. Also, Print-Job is a REQUIRED operation (all implementations MUST support
1245 it) whereas Create-Job is an OPTIONAL operation, hence some implementations might not support it.

1246 Job submission time is the point in time when a client issues a create request. The initial state of every Job
1247 object is the 'pending', 'pending-held', or 'processing' state (see section 4.3.7). **Issue 13** When the Printer
1248 object begins processing the print job, the Job object's state moves to 'processing'. This is known as job
1249 processing time. There are validation checks that must be done at job submission time and others that must
1250 be performed at job processing time.

1251 At job submission time and at the time a Validate-Job operation is received, the Printer MUST do the
1252 following:

- 1253 1. Process the client supplied attributes and either accept or reject the request
- 1254 2. Validate the syntax of and support for the scheme of any client supplied URI

1255

1256 At job submission time the Printer object MUST validate whether or not the supplied attributes, attribute
1257 syntaxes, and values are supported by matching them with the Printer object's corresponding "xxx-
1258 supported" attributes. See section 3.1.7 for details. [IPP-IIG] presents suggested steps for an IPP object to
1259 either accept or reject any request and additional steps for processing create requests.

1260 At job submission time the Printer object NEED NOT perform the validation checks reserved for job
1261 processing time such as:

- 1262 1. Validating the document data
- 1263 2. Validating the actual contents of any client supplied URI (resolve the reference and follow the link to
1264 the document data)

1265

1266 At job submission time, these additional job processing time validation checks are essentially useless, since
1267 they require actually parsing and interpreting the document data, are not guaranteed to be 100% accurate,
1268 and MUST be done, yet again, at job processing time. Also, in the case of a URI, checking for availability
1269 at job submission time does not guarantee availability at job processing time. In addition, at job processing
1270 time, the Printer object might discover any of the following conditions that were not detectable at job
1271 submission time:

- 1272 - runtime errors in the document data,
1273 - nested document data that is in an unsupported format,
1274 - the URI reference is no longer valid (i.e., the server hosting the document might be down), or
1275 - any other job processing error
1276

1277 At job submission time, a Printer object, especially a non-spooling Printer, MAY accept jobs that it does
1278 not have enough space for. In such a situation, a Printer object MAY stop reading data from a client for an
1279 indefinite period of time. A client MUST be prepared for a write operation to block for an indefinite period
1280 of time (see section 5.1 on client conformance).

1281 When a Printer object has too little space for starting a new job, it MAY reject a new create request. In this
1282 case, a Printer object MUST return a response (in reply to the rejected request) with a status-code of 'server-
1283 error-busy' (see section 14.1.5.8) and it MAY close the connection before receiving all bytes of the
1284 operation. A Printer SHOULD indicate that it is temporarily unable to accept jobs by setting the 'spool-
1285 space-full' value in its "printer-state-reasons" attribute and removing the value when it can accept another
1286 job (see section 4.4.12).

1287 When receiving a 'server-error-busy' status-code in an operation response, a client MUST be prepared for
1288 the Printer object to close the connection before the client has sent all of the data (especially for the Print-
1289 Job operation). A client MUST be prepared to keep submitting a create request until the IPP Printer object
1290 accepts the create request. **Issue 20**

1291 At job processing time, since the Printer object has already responded with a successful status code in the
1292 response to the create request, if the Printer object detects an error, the Printer object is unable to inform the
1293 end user of the error with an operation status code. In this case, the Printer, depending on the error, can set
1294 the job object's "job-state", "job-state-reasons", or "job-state-message" attributes to the appropriate value(s)
1295 so that later queries can report the correct job status.

1296 Note: Asynchronous notification of events is outside the scope of this IPP/1.1 document.

1297

1298 3.2 Printer Operations

1299 All Printer operations are directed at Printer objects. A client MUST always supply the "printer-uri"
1300 operation attribute in order to identify the correct target of the operation.

1301 3.2.1 Print-Job Operation

1302 This REQUIRED operation allows a client to submit a print job with only one document and supply the
1303 document data (rather than just a reference to the data). See Section 15 for the suggested steps for
1304 processing create operations and their Operation and Job Template attributes.

1305 3.2.1.1 Print-Job Request

1306 The following groups of attributes are supplied as part of the Print-Job Request:

1307 Group 1: Operation Attributes

1308 Natural Language and Character Set:

1309 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.
1310 The Printer object MUST copy these values to the corresponding Job Description attributes
1311 described in sections 4.3.19 and 4.3.20.

1312

1313 Target:

1314 The "printer-uri" (uri) operation attribute which is the target for this operation as described in
1315 section 3.1.5.

1316

1317 Requesting User Name:

1318 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as
1319 described in section 8.3.

1320

1321 "job-name" (name(MAX)):

1322 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It
1323 contains the client supplied Job name. If this attribute is supplied by the client, its value is used for
1324 the "job-name" attribute of the newly created Job object. The client MAY automatically include any
1325 information that will help the end-user distinguish amongst his/her jobs, such as the name of the
1326 application program along with information from the document, such as the document name,
1327 document subject, or source file name. If this attribute is not supplied by the client, the Printer
1328 generates a name to use in the "job-name" attribute of the newly created Job object (see Section
1329 4.3.5).

1330

1331 "ipp-attribute-fidelity" (boolean):

1332 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.
1333 The value 'true' indicates that total fidelity to client supplied Job Template attributes and values is
1334 required, else the Printer object MUST reject the Print-Job request. The value 'false' indicates that a
1335 reasonable attempt to print the Job object is acceptable and the Printer object MUST accept the
1336 Print-job request. If not supplied, the Printer object assumes the value is 'false'. All Printer objects
1337 MUST support both types of job processing. See section 15 for a full description of "ipp-attribute-
1338 fidelity" and its relationship to other attributes, especially the Printer object's "pdl-override-
1339 supported" attribute.

1340

1341 "document-name" (name(MAX)):

1342 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.
1343 It contains the client supplied document name. The document name MAY be different than the Job
1344 name. Typically, the client software automatically supplies the document name on behalf of the end
1345 user by using a file name or an application generated name. If this attribute is supplied, its value can
1346 be used in a manner defined by each implementation. Examples include: printed along with the Job
1347 (job start sheet, page adornments, etc.), used by accounting or resource tracking management tools,

1348 or even stored along with the document as a document level attribute. IPP/1.1 does not support the
1349 concept of document level attributes.

1350

1351 "compression" (type3 keyword)

1352 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute
1353 and the "compression-supported" attribute (see section 4.4.32). The client supplied "compression"
1354 operation attribute identifies the compression algorithm used on the document data. The following
1355 cases exist:

- 1356 a) If the client omits this attribute, the Printer object MUST assume that the data is not
1357 compressed (i.e. the Printer follows the rules below as if the client supplied the
1358 "compression" attribute with a value of 'none').
- 1359 b) If the client supplies this attribute, but the value is not supported by the Printer object,
1360 i.e., the value is not one of the values of the Printer object's "compression-supported"
1361 attribute, the Printer object MUST reject the request, and return the 'client-error-
1362 compression-not-supported' status code. See section 3.1.7 for returning unsupported
1363 attributes and values.
- 1364 c) If the client supplies the attribute and the Printer object supports the attribute value, the
1365 Printer object uses the corresponding decompression algorithm on the document data.
- 1366 d) If the decompression algorithm fails before the Printer returns an operation response, the
1367 Printer object MUST reject the request and return the 'client-error-compression-error'
1368 status code.
- 1369 e) If the decompression algorithm fails after the Printer returns an operation response, the
1370 Printer object MUST abort the job and add the 'compression-error' value to the job's
1371 "job-state-reasons" attribute.
- 1372 f) If the decompression algorithm succeeds, the document data MUST then have the format
1373 specified by the job's "document-format" attribute, if supplied (see "document-format"
1374 operation attribute definition below). **Issue 28**

1375

1376 "document-format" (mimeMediaType) :

1377 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.
1378 The value of this attribute identifies the format of the supplied document data. The following cases
1379 exist:

- 1380 a) If the client does not supply this attribute, the Printer object assumes that the document
1381 data is in the format defined by the Printer object's "document-format-default" attribute.
1382 (i.e. the Printer follows the rules below as if the client supplied the "document-format"
1383 attribute with a value equal to the printer's default value).
- 1384 b) If the client supplies this attribute, but the value is not supported by the Printer object,
1385 i.e., the value is not one of the values of the Printer object's "document-format-
1386 supported" attribute, the Printer object MUST reject the request and return the 'client-
1387 error-document-format-not-supported' status code.
- 1388 c) If the client supplies this attribute and its value is 'application/octet-stream' (i.e. to be
1389 auto-sensed, see Section 4.1.9.1), and the format is not one of the document-formats that
1390 the Printer can auto-sense, and this check occurs before the Printer returns an operation
1391 response, then the Printer MUST reject the request and return the 'client-error-
1392 document-format-not-supported' status code.

- 1393 d) If the client supplies this attribute, and the value is supported by the Printer object, the
1394 document data, the Printer is capable of interpreting the document data.
1395 e) If interpreting of the document data fails before the Printer returns an operation response,
1396 the Printer object MUST reject the request and return the 'client-error-document-format-
1397 error' status code.
1398 f) If interpreting of the document data fails after the Printer returns an operation response,
1399 the Printer object MUST abort the job and add the 'document-format-error' value to the
1400 job's "job-state-reasons" attribute. **Issue 11**

1401
1402 "document-natural-language" (naturalLanguage):

1403 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this
1404 attribute. This attribute specifies the natural language of the document for those document-formats
1405 that require a specification of the natural language in order to image the document unambiguously.
1406 There are no particular values required for the Printer object to support.
1407
1408

1409 "job-k-octets" (integer(0:MAX))

1410 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this
1411 attribute and the "job-k-octets-supported" attribute (see section 4.4.33). The client supplied "job-k-
1412 octets" operation attribute identifies the total size of the document(s) in K octets being submitted
1413 (see section 4.3.17.1 for the complete semantics). If the client supplies the attribute and the Printer
1414 object supports the attribute, the value of the attribute is used to populate the Job object's "job-k-
1415 octets" Job Description attribute.
1416

1417 For this attribute and the following two attributes ("job-impressions", and "job-media-sheets"), if the
1418 client supplies the attribute, but the Printer object does not support the attribute, the Printer object
1419 ignores the client-supplied value. If the client supplies the attribute and the Printer supports the
1420 attribute, and the value is within the range of the corresponding Printer object's "xxx-supported"
1421 attribute, the Printer object MUST use the value to populate the Job object's "xxx" attribute. If the
1422 client supplies the attribute and the Printer supports the attribute, but the value is outside the range
1423 of the corresponding Printer object's "xxx-supported" attribute, the Printer object MUST copy the
1424 attribute and its value to the Unsupported Attributes response group, reject the request, and return
1425 the 'client-error-attributes-or-values-not-supported' status code. If the client does not supply the
1426 attribute, the Printer object MAY choose to populate the corresponding Job object attribute
1427 depending on whether the Printer object supports the attribute and is able to calculate or discern the
1428 correct value.
1429

1430 "job-impressions" (integer(0:MAX))

1431 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this
1432 attribute and the "job-impressions-supported" attribute (see section 4.4.34). The client supplied
1433 "job-impressions" operation attribute identifies the total size in number of impressions of the
1434 document(s) being submitted (see section 4.3.17.2 for the complete semantics).
1435

1436 See last paragraph under "job-k-octets".
1437

1438 "job-media-sheets" (integer(0:MAX))

1439 The client **OPTIONALLY** supplies this attribute. The Printer object **OPTIONALLY** supports this
1440 attribute and the "job-media-sheets-supported" attribute (see section 4.4.35). The client supplied
1441 "job-media-sheets" operation attribute identifies the total number of media sheets to be produced for
1442 this job (see section 4.3.17.3 for the complete semantics).

1443

1444 See last paragraph under "job-k-octets".

1445

1446 Group 2: Job Template Attributes

1447 The client **OPTIONALLY** supplies a set of Job Template attributes as defined in section 4.2. If the
1448 client is not supplying any Job Template attributes in the request, the client **SHOULD** omit Group 2
1449 rather than sending an empty group. However, a Printer object **MUST** be able to accept an empty
1450 group.

1451

1452 Group 3: Document Content

1453 The client **MUST** supply the document data to be processed.

1454

1455 In addition to the **MANDATORY** parameters required for every operation request, the simplest Print-Job
1456 Request consists of just the "attributes-charset" and "attributes-natural-language" operation attributes; the
1457 "printer-uri" target operation attribute; the Document Content and nothing else. In this simple case, the
1458 Printer object:

- 1459 - creates a new Job object (the Job object contains a single document),
- 1460 - stores a generated Job name in the "job-name" attribute in the natural language and charset requested
1461 (see Section 3.1.4.1) (if those are supported, otherwise using the Printer object's default natural
1462 language and charset), and
- 1463 - at job processing time, uses its corresponding default value attributes for the supported Job Template
1464 attributes that were not supplied by the client as IPP attribute or embedded instructions in the
1465 document data.

1466

1467 3.2.1.2 Print-Job Response

1468 The Printer object **MUST** return to the client the following sets of attributes as part of the Print-Job
1469 Response:

1470 Group 1: Operation Attributes

1471 Status Message:

1472 In addition to the **REQUIRED** status code returned in every response, the response **OPTIONALLY**
1473 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6. If
1474 the client supplies unsupported or conflicting Job Template attributes or values, the Printer object
1475 **MUST** reject or accept the Print-Job request depending on the whether the client supplied a 'true' or

1476 'false' value for the "ipp-attribute-fidelity" operation attribute. See the Implementer's Guide [IPP-
1477 IIG] for a complete description of the suggested steps for processing a create request.

1478

1479 Natural Language and Character Set:

1480 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

1481

1482 Group 2: Unsupported Attributes

1483 See section 3.1.7 for details on returning Unsupported Attributes.

1484

1485 The value of the "ipp-attribute-fidelity" supplied by the client does not affect what attributes the
1486 Printer object returns in this group. The value of "ipp-attribute-fidelity" only affects whether the
1487 Print-Job operation is accepted or rejected. If the job is accepted, the client may query the job using
1488 the Get-Job-Attributes operation requesting the unsupported attributes that were returned in the
1489 create response to see which attributes were ignored (not stored on the Job object) and which
1490 attributes were stored with other (substituted) values.

1491

1492 Group 3: Job Object Attributes

1493 "job-uri" (uri):

1494 The Printer object MUST return the Job object's URI by returning the contents of the REQUIRED
1495 "job-uri" Job object attribute. The client uses the Job object's URI when directing operations at the
1496 Job object. The Printer object always uses its configured security policy when creating the new
1497 URI. However, if the Printer object supports more than one URI, the Printer object also uses
1498 information about which URI was used in the Print-Job Request to generated the new URI so that
1499 the new URI references the correct access channel. In other words, if the Print-Job Request comes
1500 in over a secure channel, the Printer object MUST generate a Job URI that uses the secure channel
1501 as well.

1502

1503 "job-id" (integer(1:MAX)):

1504 The Printer object MUST return the Job object's Job ID by returning the REQUIRED "job-id" Job
1505 object attribute. The client uses this "job-id" attribute in conjunction with the "printer-uri" attribute
1506 used in the Print-Job Request when directing Job operations at the Printer object.

1507

1508 "job-state":

1509 The Printer object MUST return the Job object's REQUIRED "job-state" attribute. The value of this
1510 attribute (along with the value of the next attribute: "job-state-reasons") is taken from a "snapshot"
1511 of the new Job object at some meaningful point in time (implementation defined) between when the
1512 Printer object receives the Print-Job Request and when the Printer object returns the response.

1513

1514 "job-state-reasons":

1515 The Printer object MUST return the Job object's REQUIRED "job-state-reasons" attribute. . Issue

1516 30

1517

1518 "job-state-message":
1519 The Printer object **OPTIONALLY** returns the Job object's **OPTIONAL** "job-state-message"
1520 attribute. If the Printer object supports this attribute then it **MUST** be returned in the response. If
1521 this attribute is not returned in the response, the client can assume that the "job-state-message"
1522 attribute is not supported and will not be returned in a subsequent Job object query.

1523
1524 "number-of-intervening-jobs":
1525 The Printer object **OPTIONALLY** returns the Job object's **OPTIONAL** "number-of-intervening-
1526 jobs" attribute. If the Printer object supports this attribute then it **MUST** be returned in the response.
1527 If this attribute is not returned in the response, the client can assume that the "number-of-
1528 intervening-jobs" attribute is not supported and will not be returned in a subsequent Job object
1529 query.

1531 Note: Since any printer state information which affects a job's state is reflected in the "job-state" and
1532 "job-state-reasons" attributes, it is sufficient to return only these attributes and no specific printer
1533 status attributes.

1534

1535 Note: In addition to the **MANDATORY** parameters required for every operation response, the simplest
1536 response consists of the just the "attributes-charset" and "attributes-natural-language" operation attributes
1537 and the "job-uri", "job-id", and "job-state" Job Object Attributes. In this simplest case, the status code is
1538 'successful-ok' and there is no "status-message" operation attribute.

1539 3.2.2 Print-URI Operation

1540 This **OPTIONAL** operation is identical to the Print-Job operation (section 3.2.1) except that a client
1541 supplies a URI reference to the document data using the "document-uri" (uri) operation attribute (in Group
1542 1) rather than including the document data itself. Before returning the response, the Printer **MUST** validate
1543 that the Printer supports the retrieval method (e.g., http, ftp, etc.) implied by the URI, and **MUST** check for
1544 valid URI syntax. If the client-supplied URI scheme is not supported, i.e. the value is not in the Printer
1545 object's "referenced-uri-scheme-supported" attribute, the Printer object **MUST** reject the request and return
1546 the 'client-error-uri-scheme-not-supported' status code.

1547 The IPP Printer **MAY** validate the accessibility of the document as part of the operation or subsequently. If
1548 the Printer determines an accessibility problem before returning an operation response, it rejects the request
1549 and returns the 'client-error-document-access-error' status code. The Printer **MAY** also return a specific
1550 document access error code using the "document-access-error" operation attribute (see section 3.1.6.4).

1551 **Issue 35**

1552 If the Printer determines this document accessibility problem after accepting the request and returning an
1553 operation response with one of the successful status codes, the Printer adds the 'document-access-error'
1554 value to the job's "job-state-reasons" attribute and **MAY** populate the job's "job-document-access-errors"
1555 Job Description attribute (see section 4.3.11). See The Implementer's Guide [IPP-IIG] for suggested
1556 additional checks. **Issue 35**

1557 If the Printer object supports this operation, it MUST support the "reference-uri-schemes-supported" Printer
1558 attribute (see section 4.4.27).

1559 It is up to the IPP object to interpret the URI and subsequently "pull" the document from the source
1560 referenced by the URI string.

1561 3.2.3 Validate-Job Operation

1562 This REQUIRED operation is similar to the Print-Job operation (section 3.2.1) except that a client supplies
1563 no document data and the Printer allocates no resources (i.e., it does not create a new Job object). This
1564 operation is used only to verify capabilities of a printer object against whatever attributes are supplied by
1565 the client in the Validate-Job request. By using the Validate-Job operation a client can validate that an
1566 identical Print-Job operation (with the document data) would be accepted. The Validate-Job operation also
1567 performs the same security negotiation as the Print-Job operation (see section 8), so that a client can check
1568 that the client and Printer object security requirements can be met before performing a Print-Job operation.

1569 The Validate-Job operation does not accept a "document-uri" attribute in order to allow a client to check
1570 that the same Print-URI operation will be accepted, since the client doesn't send the data with the Print-URI
1571 operation. The client SHOULD just issue the Print-URI request.

1572 The Printer object returns the same status codes, Operation Attributes (Group 1) and Unsupported
1573 Attributes (Group 2) as the Print-Job operation. However, no Job Object Attributes (Group 3) are returned,
1574 since no Job object is created.

1575 3.2.4 Create-Job Operation

1576 This OPTIONAL operation is similar to the Print-Job operation (section 3.2.1) except that in the Create-Job
1577 request, a client does not supply document data or any reference to document data. Also, the client does not
1578 supply any of the "document-name", "document-format", "compression", or "document-natural-language"
1579 operation attributes. This operation is followed by one or more Send-Document or Send-URI operations.
1580 In each of those operation requests, the client OPTIONALLY supplies the "document-name", "document-
1581 format", and "document-natural-language" attributes for each document in the multi-document Job object.

1582 If a Printer object supports the Create-Job operation, it MUST also support the Send-Document operation
1583 and also MAY support the Send-URI operation.

1584 If the Printer object supports this operation, it MUST support the "multiple-operation-time-out" Printer
1585 attribute (see section 4.4.31).

1586 If the Printer object supports this operation, then it MUST support the "multiple-document-jobs-supported"
1587 Printer Description attribute (see section 4.4.16) and indicate whether or not it supports multiple-document
1588 jobs. **Issue 34**

1589 If the Printer object supports this operation and supports multiple documents in a job, then it MUST support
1590 the "multiple-document-handling" Job Template job attribute with at least one value (see section 4.2.4) and

1591 the associated "multiple-document-handling-default" and "multiple-document-handling-supported" Job
1592 Template Printer attributes (see section 4.2). **Issue 34**

1593 After the Create-Job operation has completed, the value of the "job-state" attribute is similar to the "job-
1594 state" after a Print-Job, even though no document-data has arrived. A Printer MAY set the 'job-data-
1595 insufficient' value of the job's "job-state-reason" attribute to indicate that processing cannot begin until
1596 sufficient data has arrived and set the "job-state" to either 'pending' or 'pending-held'. A non-spooling
1597 printer that doesn't implement the 'pending' job state may even set the "job-state" to 'processing', even
1598 though there is not yet any data to process. See sections 4.3.7 and 4.3.8. **Issue 13**

1599 3.2.5 Get-Printer-Attributes Operation

1600 This REQUIRED operation allows a client to request the values of the attributes of a Printer object. In the
1601 request, the client supplies the set of Printer attribute names and/or attribute group names in which the
1602 requester is interested. In the response, the Printer object returns a corresponding attribute set with the
1603 appropriate attribute values filled in.

1604 For Printer objects, the possible names of attribute groups are:

- 1605 - 'job-template': the subset of the Job Template attributes that apply to a Printer object (the last two
1606 columns of the table in Section 4.2) that the implementation supports for Printer objects.
- 1607 - 'printer-description': the subset of the attributes specified in Section 4.4 that the implementation
1608 supports for Printer objects.
- 1609 - 'all': the special group 'all' that includes all attributes that the implementation supports for Printer
1610 objects. **Issue 23**

1611
1612 Since a client MAY request specific attributes or named groups, there is a potential that there is some
1613 overlap. For example, if a client requests, 'printer-name' and 'all', the client is actually requesting the
1614 "printer-name" attribute twice: once by naming it explicitly, and once by inclusion in the 'all' group. In such
1615 cases, the Printer object NEED NOT return each attribute only once in the response even if it is requested
1616 multiple times. The client SHOULD NOT request the same attribute in multiple ways.

1617 It is NOT REQUIRED that a Printer object support all attributes belonging to a group (since some attributes
1618 are OPTIONAL). However, it is REQUIRED that each Printer object support all group names.

1619 3.2.5.1 Get-Printer-Attributes Request

1620 The following sets of attributes are part of the Get-Printer-Attributes Request:

1621 Group 1: Operation Attributes

1622 Natural Language and Character Set:

1623 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

1624

1625
1626
1627
1628
1629
1630
1631
1632
1633
1634
1635
1636
1637
1638
1639
1640
1641
1642
1643
1644
1645
1646
1647
1648
1649
1650
1651
1652
1653
1654
1655
1656
1657
1658
1659
1660
1661
1662
1663
1664
1665
1666
1667
1668
1669

Target:

The "printer-uri" (uri) operation attribute which is the target for this operation as described in section 3.1.5.

Requesting User Name:

The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as described in section 8.3.

"requested-attributes" (1setOf keyword) :

The client OPTIONALLY supplies a set of attribute names and/or attribute group names in whose values the requester is interested. The Printer object MUST support this attribute. If the client omits this attribute, the Printer MUST respond as if this attribute had been supplied with a value of 'all'.

"document-format" (mimeMediaType) :

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. This attribute is useful for a Printer object to determine the set of supported attribute values that relate to the requested document format. The Printer object MUST return the attributes and values that it uses to validate a job on a create or Validate-Job operation in which this document format is supplied. The Printer object SHOULD return only (1) those attributes that are supported for the specified format and (2) the attribute values that are supported for the specified document format. By specifying the document format, the client can get the Printer object to eliminate the attributes and values that are not supported for a specific document format. For example, a Printer object might have multiple interpreters to support both 'application/postscript' (for PostScript) and 'text/plain' (for text) documents. However, for only one of those interpreters might the Printer object be able to support "number-up" with values of '1', '2', and '4'. For the other interpreter it might be able to only support "number-up" with a value of '1'. Thus a client can use the Get-Printer-Attributes operation to obtain the attributes and values that will be used to accept/reject a create job operation.

If the Printer object does not distinguish between different sets of supported values for each different document format when validating jobs in the create and Validate-Job operations, it MUST NOT distinguish between different document formats in the Get-Printer-Attributes operation. If the Printer object does distinguish between different sets of supported values for each different document format specified by the client, this specialization applies only to the following Printer object attributes:

- Printer attributes that are Job Template attributes ("xxx-default" "xxx-supported", and "xxx-ready" in the Table in Section 4.2),
- "pdl-override-supported",
- "compression-supported",
- "job-k-octets-supported",
- "job-impressions-supported",
- "job-media-sheets-supported"
- "printer-driver-installer",

- 1670 - "color-supported", and
1671 - "reference-uri-schemes-supported"

1672
1673 The values of all other Printer object attributes (including "document-format-supported") remain
1674 invariant with respect to the client supplied document format (except for new Printer description
1675 attribute as registered according to section 6.2).

1676
1677 If the client omits this "document-format" operation attribute, the Printer object MUST respond as if
1678 the attribute had been supplied with the value of the Printer object's "document-format-default"
1679 attribute. It is recommended that the client always supply a value for "document-format", since the
1680 Printer object's "document-format-default" may be 'application/octet-stream', in which case the
1681 returned attributes and values are for the union of the document formats that the Printer can
1682 automatically sense. For more details, see the description of the 'mimeType' attribute syntax
1683 in section 4.1.9.

1684
1685 If the client supplies a value for the "document-format" Operation attribute that is not supported by
1686 the Printer, i.e., is not among the values of the Printer object's "document-format-supported"
1687 attribute, the Printer object MUST reject the operation and return the 'client-error-document-format-
1688 not-supported' status code.
1689

1690 3.2.5.2 Get-Printer-Attributes Response

1691 The Printer object returns the following sets of attributes as part of the Get-Printer-Attributes Response:

1692 Group 1: Operation Attributes

1693 Status Message:

1694 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY
1695 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

1696

1697 Natural Language and Character Set:

1698 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

1699

1700 Group 2: Unsupported Attributes

1701 See section 3.1.7 for details on returning Unsupported Attributes.

1702

1703 The response NEED NOT contain the "requested-attributes" operation attribute with any supplied
1704 values (attribute keywords) that were requested by the client but are not supported by the IPP object.
1705 If the Printer object does include unsupported attributes referenced in "requested-attributes" and
1706 such attributes include group names, such as 'all', the unsupported attributes MUST NOT include
1707 attributes described in the standard but not supported by the implementation. **Issue 23**
1708

1708

1709 Group 3: Printer Object Attributes

1710 This is the set of requested attributes and their current values. The Printer object ignores (does not
1711 respond with) any requested attribute which is not supported. The Printer object MAY respond with
1712 a subset of the supported attributes and values, depending on the security policy in force. However,
1713 the Printer object MUST respond with the 'unknown' value for any supported attribute (including all
1714 REQUIRED attributes) for which the Printer object does not know the value. Also the Printer
1715 object MUST respond with the 'no-value' for any supported attribute (including all REQUIRED
1716 attributes) for which the system administrator has not configured a value. See the description of the
1717 "out-of-band" values in the beginning of Section 4.1.
1718

1719 3.2.6 Get-Jobs Operation

1720 This REQUIRED operation allows a client to retrieve the list of Job objects belonging to the target Printer
1721 object. The client may also supply a list of Job attribute names and/or attribute group names. A group of
1722 Job object attributes will be returned for each Job object that is returned.

1723 This operation is similar to the Get-Job-Attributes operation, except that this Get-Jobs operation returns
1724 attributes from possibly more than one object (see the description of Job attribute group names in section
1725 3.3.4).

1726 3.2.6.1 Get-Jobs Request

1727 The client submits the Get-Jobs request to a Printer object.

1728 The following groups of attributes are part of the Get-Jobs Request:

1729 Group 1: Operation Attributes

1730 Natural Language and Character Set:

1731 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.
1732

1733 Target:

1734 The "printer-uri" (uri) operation attribute which is the target for this operation as described in
1735 section 3.1.5.
1736

1737 Requesting User Name:

1738 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as
1739 described in section 8.3.
1740

1741 "limit" (integer(1:MAX)):

1742 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It
1743 is an integer value that determines the maximum number of jobs that a client will receive from the
1744 Printer even if "which-jobs" or "my-jobs" constrain which jobs are returned. The limit is a "stateless
1745 limit" in that if the value supplied by the client is 'N', then only the first 'N' jobs are returned in the
1746 Get-Jobs Response. There is no mechanism to allow for the next 'M' jobs after the first 'N' jobs. If
1747 the client does not supply this attribute, the Printer object responds with all applicable jobs. **Issue 8**

1748

1749

"requested-attributes" (1setOf keyword):

1750

The client **OPTIONALLY** supplies this attribute. The Printer object **MUST** support this attribute. It is a set of Job attribute names and/or attribute groups names in whose values the requester is interested. This set of attributes is returned for each Job object that is returned. The allowed attribute group names are the same as those defined in the Get-Job-Attributes operation in section 3.3.4. If the client does not supply this attribute, the Printer **MUST** respond as if the client had supplied this attribute with two values: 'job-uri' and 'job-id'.

1751

1752

1753

1754

1755

1756

1757

"which-jobs" (keyword):

1758

The client **OPTIONALLY** supplies this attribute. The Printer object **MUST** support this attribute. It indicates which Job objects **MUST** be returned by the Printer object. The values for this attribute are:

1759

1760

1761

'completed': This includes any Job object whose state is 'completed', 'canceled', or 'aborted'.

1762

1763

'not-completed': This includes any Job object whose state is 'pending', 'processing', 'processing-stopped', or 'pending-held'.

1764

1765

1766

A Printer object **MUST** support both values. However, if the implementation does not keep jobs in the 'completed', 'canceled', and 'aborted' states, then it returns no jobs when the 'completed' value is supplied.

1767

1768

1769

1770

If a client supplies some other value, the Printer object **MUST** copy the attribute and the unsupported value to the Unsupported Attributes response group, reject the request, and return the 'client-error-attributes-or-values-not-supported' status code.

1771

1772

1773

1774

If the client does not supply this attribute, the Printer object **MUST** respond as if the client had supplied the attribute with a value of 'not-completed'.

1775

1776

1777

"my-jobs" (boolean):

1778

The client **OPTIONALLY** supplies this attribute. The Printer object **MUST** support this attribute. It indicates whether jobs from all users or just the jobs submitted by the requesting user of this request **MUST** be returned by the Printer object. If the client does not supply this attribute, the Printer object **MUST** respond as if the client had supplied the attribute with a value of 'false', i.e., jobs from all users. The means for authenticating the requesting user and matching the jobs is described in section 8.

1779

1780

1781

1782

1783

1784

3.2.6.2 Get-Jobs Response

1785

The Printer object returns all of the Job objects up to the number specified by the "limit" attribute that match the criteria as defined by the attribute values supplied by the client in the request. It is possible that no Job objects are returned since there may literally be no Job objects at the Printer, or there may be no Job objects that match the criteria supplied by the client. If the client requests any Job attributes at all, there is a set of Job Object Attributes returned for each Job object.

1786

1787

1788

1789

1790 It is not an error for the Printer to return 0 jobs. If the response returns 0 jobs because there are no jobs
1791 matching the criteria, and the request would have returned 1 or more jobs with a status code of 'successful-
1792 ok' if there had been jobs matching the criteria, then the status code for 0 jobs MUST be 'successful-ok'.
1793

Issue 24

1794 Group 1: Operation Attributes

Status Message:

1795 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY
1796 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.
1797
1798

Natural Language and Character Set:

1799 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.
1800
1801

1802 Group 2: Unsupported Attributes

1803 See section 3.1.7 for details on returning Unsupported Attributes.
1804

1805 The response NEED NOT contain the "requested-attributes" operation attribute with any supplied
1806 values (attribute keywords) that were requested by the client but are not supported by the IPP object.
1807 If the Printer object does include unsupported attributes referenced in "requested-attributes" and
1808 such attributes include group names, such as 'all', the unsupported attributes MUST NOT include
1809 attributes described in the standard but not supported by the implementation. Issue 23
1810

1811 Groups 3 to N: Job Object Attributes

1812 The Printer object responds with one set of Job Object Attributes for each returned Job object. The
1813 Printer object ignores (does not respond with) any requested attribute or value which is not
1814 supported or which is restricted by the security policy in force, including whether the requesting
1815 user is the user that submitted the job (job originating user) or not (see section 8). However, the
1816 Printer object MUST respond with the 'unknown' value for any supported attribute (including all
1817 REQUIRED attributes) for which the Printer object does not know the value, unless it would violate
1818 the security policy. See the description of the "out-of-band" values in the beginning of Section 4.1.
1819

1820 Jobs are returned in the following order:

- 1821 - If the client requests all 'completed' Jobs (Jobs in the 'completed', 'aborted', or 'canceled' states),
1822 then the Jobs are returned newest to oldest (with respect to actual completion time)
- 1823 - If the client requests all 'not-completed' Jobs (Jobs in the 'pending', 'processing', 'pending-held',
1824 and 'processing-stopped' states), then Jobs are returned in relative chronological order of
1825 expected time to complete (based on whatever scheduling algorithm is configured for the
1826 Printer object).

1827 3.2.7 Pause-Printer Operation

1828 This OPTIONAL operation allows a client to stop the Printer object from scheduling jobs on all its devices.
1829 Depending on implementation, the Pause-Printer operation MAY also stop the Printer from processing the

1830 current job or jobs. Any job that is currently being printed is either stopped as soon as the implementation
 1831 permits or is completed, depending on implementation. The Printer object MUST still accept create
 1832 operations to create new jobs, but MUST prevent any jobs from entering the 'processing' state.

1833 If the Pause-Printer operation is supported, then the Resume-Printer operation MUST be supported, and
 1834 vice-versa.

1835 The IPP Printer stops the current job(s) on its device(s) that were in the 'processing' or 'processing-stopped'
 1836 states as soon as the implementation permits. If the implementation **Issue 30** will take appreciable time to
 1837 stop, the IPP Printer adds the 'moving-to-paused' value to the Printer object's "printer-state-reasons"
 1838 attribute (see section 4.4.12). When the device(s) have all stopped, the IPP Printer transitions the Printer
 1839 object to the 'stopped' state, removes the 'moving-to-paused' value, if present, and adds the 'paused' value to
 1840 the Printer object's "printer-state-reasons" attribute.

1841 When the current job(s) complete that were in the 'processing' state, the IPP Printer transitions them to the
 1842 'completed' state. When the current job(s) stop in mid processing that were in the 'processing' state, the IPP
 1843 Printer transitions them to the 'processing-stopped' state and **Issue 30** adds the 'printer-stopped' value to the
 1844 job's "job-state-reasons" attribute.

1845 For any jobs that are 'pending' or 'pending-held', the 'printer-stopped' value of the jobs' "job-state-reasons"
 1846 attribute also applies. However, the IPP Printer NEED NOT update those jobs' "job-state-reasons"
 1847 attributes and only need return the 'printer-stopped' value when those jobs are queried (so-called "lazy
 1848 evaluation").

1849 Whether the Pause-Printer operation affects jobs that were submitted to the device from other sources than
 1850 the IPP Printer object in the same way that the Pause-Printer operation affects jobs that were submitted to
 1851 the IPP Printer object using IPP, depends on implementation, i.e., on whether the IPP protocol is being used
 1852 as a universal management protocol or just to manage IPP jobs, respectively.

1853 The IPP Printer MUST accept the request in any state and transition the Printer to the indicated new
 1854 "printer-state" before returning as follows:

Current "printer-state"	New "printer-state"	"printer-state-reasons"	IPP Printer's response status code and action:
'idle'	'stopped'	'paused'	'successful-ok'
'processing'	'processing'	'moving-to-paused'	OPTION 1: 'successful-ok'; Later, when all output has stopped, the "printer-state" becomes 'stopped', and the 'paused' value replaces the 'moving-to-paused' value in the "printer-state-reasons" attribute
'processing'	'stopped'	'paused'	OPTION 2: 'successful-ok'; all device output stopped immediately
'stopped'	'stopped'	'paused'	'successful-ok'

1855 *Access Rights:* The authenticated user (see section 8.3) performing this operation must be an operator or
1856 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP Printer **MUST** reject the
1857 operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized'
1858 as appropriate.

1859 3.2.7.1 Pause-Printer Request

1860 The following groups of attributes are part of the Pause-Printer Request:

1861 Group 1: Operation Attributes

1862 Natural Language and Character Set:

1863 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

1864

1865 Target:

1866 The "printer-uri" (uri) operation attribute which is the target for this operation as described in
1867 section 3.1.5.

1868

1869 Requesting User Name:

1870 The "requesting-user-name" (name(MAX)) attribute **SHOULD** be supplied by the client as
1871 described in section 8.3.

1872 3.2.7.2 Pause-Printer Response

1873 The following groups of attributes are part of the Pause-Printer Response:

1874 Group 1: Operation Attributes

1875 Status Message:

1876 In addition to the **REQUIRED** status code returned in every response, the response **OPTIONALLY**
1877 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

1878

1879 Natural Language and Character Set:

1880 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

1881

1882 Group 2: Unsupported Attributes

1883 See section 3.1.7 for details on returning Unsupported Attributes.

1884

1885 3.2.8 Resume-Printer Operation

1886 This operation allows a client to resume the Printer object scheduling jobs on all its devices. The Printer
1887 object **Issue 30** **MUST** remove the 'paused' and 'moving-to-paused' values from the Printer object's
1888 "printer-state-reasons" attribute, if present. If there are no other reasons to keep a device paused (such as
1889 media-jam), the IPP Printer transitions itself to the 'processing' or 'idle' states, depending on whether there
1890 are jobs to be processed or not, respectively, and the device(s) resume processing jobs.

1891 If the Pause-Printer operation is supported, then the Resume-Printer operation MUST be supported, and
 1892 vice-versa.

1893 The IPP Printer removes the 'printer-stopped' value from any job's "job-state-reasons" attributes contained
 1894 in that Printer.

1895 The IPP Printer MUST accept the request in any state, transition the Printer object to the indicated new state
 1896 as follows:

Current "printer-state"	New "printer-state"	IPP Printer's response status code and action:
'idle'	'idle'	'successful-ok'
'processing'	'processing'	'successful-ok'
'stopped'	'processing'	'successful-ok'; when there are jobs to be processed
'stopped'	'idle'	'successful-ok'; when there are no jobs to be processed.

1897 *Access Rights:* The authenticated user (see section 8.3) performing this operation must be an operator or
 1898 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP Printer MUST reject the
 1899 operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized'
 1900 as appropriate.

1901 The Resume-Printer Request and Resume-Printer Response have the same attribute groups and attributes as
 1902 the Pause-Printer operation (see sections 3.2.7.1 and 3.2.7.2).

1903 3.2.9 Purge-Jobs Operation

1904 This OPTIONAL operation allows a client to remove all jobs from an IPP Printer object, regardless of their
 1905 job states, including jobs in the Printer object's Job History (see Section 4.3.7.2). After a Purge-Jobs
 1906 operation has been performed, a Printer object MUST return no jobs in subsequent Get-Job-Attributes and
 1907 Get-Jobs responses (until new jobs are submitted).

1908 Whether the Purge-Jobs (and Get-Jobs) operation affects jobs that were submitted to the device from other
 1909 sources than the IPP Printer object in the same way that the Purge-Jobs operation affects jobs that were
 1910 submitted to the IPP Printer object using IPP, depends on implementation, i.e., on whether the IPP protocol
 1911 is being used as a universal management protocol or just to manage IPP jobs, respectively.

1912 Note: if an operator wants to cancel all jobs without clearing out the Job History, the operator uses the
 1913 Cancel-Job operation on each job instead of using the Purge-Job operation.

1914 The Printer object MUST accept this operation in any state and transition the Printer object to the 'idle'
 1915 state.

1916 *Access Rights:* The authenticated user (see section 8.3) performing this operation must be an operator or
 1917 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP object MUST reject the

1918 operation and return: client-error-forbidden, client-error-not-authenticated, and client-error-not-authorized
1919 as appropriate.

1920 The Purge-Jobs Request and Purge-Jobs Response have the same attribute groups and attributes as the
1921 Pause-Printer operation (see sections 3.2.7.1 and 3.2.7.2).

1922

1923 3.3 Job Operations

1924 All Job operations are directed at Job objects. A client **MUST** always supply some means of identifying the
1925 Job object in order to identify the correct target of the operation. That job identification **MAY** either be a
1926 single Job URI or a combination of a Printer URI with a Job ID. The IPP object implementation **MUST**
1927 support both forms of identification for every job.

1928 3.3.1 Send-Document Operation

1929 This **OPTIONAL** operation allows a client to create a multi-document Job object that is initially "empty"
1930 (contains no documents). In the Create-Job response, the Printer object returns the Job object's URI (the
1931 "job-uri" attribute) and the Job object's 32-bit identifier (the "job-id" attribute). For each new document
1932 that the client desires to add, the client uses a Send-Document operation. Each Send-Document Request
1933 contains the entire stream of document data for one document.

1934 If the Printer supports this operation but does not support multiple documents per job, the Printer **MUST**
1935 reject subsequent Send-Document operations supplied with data and return the 'server-error-multiple-
1936 document-jobs-not-supported'. However, the Printer **MUST** accept the first document with a 'true' or 'false'
1937 value for the "last-document" operation attribute (see below), so that clients **MAY** always submit one
1938 document jobs with a 'false' value for "last-document" in the first Send-Document and a 'true' for "last-
1939 document" in the second Send-Document (with no data). **Issue 34**

1940 Since the Create-Job and the send operations (Send-Document or Send-URI operations) that follow could
1941 occur over an arbitrarily long period of time for a particular job, a client **MUST** send another send operation
1942 within an IPP Printer defined minimum time interval after the receipt of the previous request for the job. If
1943 a Printer object supports multiple document jobs, the Printer object **MUST** support the "multiple-operation-
1944 time-out" attribute (see section 4.4.31). This attribute indicates the minimum number of seconds the Printer
1945 object will wait for the next send operation before taking some recovery action.

1946 An IPP object **MUST** recover from an errant client that does not supply a send operation, sometime after
1947 the minimum time interval specified by the Printer object's "multiple-operation-time-out" attribute. Such
1948 recovery **MAY** include any of the following or other recovery actions:

1949 1. Assume that the Job is an invalid job, start the process of changing the job state to 'aborted', add the
1950 'aborted-by-system' value to the job's "job-state-reasons" attribute (see section 4.3.8), **Issue 30** and
1951 clean up all resources associated with the Job. In this case, if another send operation is finally
1952 received, the Printer responds with an "client-error-not-possible" or "client-error-not-found"
1953 depending on whether or not the Job object is still around when the send operation finally arrives.

- 1954 2. Assume that the last send operation received was in fact the last document (as if the "last-document"
1955 flag had been set to 'true'), close the Job object, and proceed to process it (i.e., move the Job's state
1956 to 'pending').
- 1957 3. Assume that the last send operation received was in fact the last document, close the Job, but move it
1958 to the 'pending-held' and add the 'submission-interrupted' value to the job's "job-state-reasons"
1959 attribute (see section 4.3.8). **Issue 30** This action allows the user or an operator to determine
1960 whether to continue processing the Job by moving it back to the 'pending' state using the Release-
1961 Job operation (see section 3.3.6) or to cancel the job using the Cancel-Job operation (see section
1962 3.3.3).
- 1963

1964 Each implementation is free to decide the "best" action to take depending on local policy, whether any
1965 documents have been added, whether the implementation spools jobs or not, and/or any other piece of
1966 information available to it. If the choice is to abort the Job object, it is possible that the Job object may
1967 already have been processed to the point that some media sheet pages have been printed.

1968 *Access Rights:* The authenticated user (see section 8.3) performing this operation must either be the job
1969 owner (as determined in the Create-Job operation) or an operator or administrator of the Printer object (see
1970 Sections 1 and 8.5). Otherwise, the IPP object MUST reject the operation and return: 'client-error-
1971 forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized' as appropriate. **Issue 19**

1972 3.3.1.1 Send-Document Request

1973 The following attribute sets are part of the Send-Document Request:

1974 Group 1: Operation Attributes

1975 Natural Language and Character Set:

1976 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

1977

1978 Target:

1979 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation
1980 attribute(s) which define the target for this operation as described in section 3.1.5.

1981

1982 Requesting User Name:

1983 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as
1984 described in section 8.3.

1985

1986 "document-name" (name(MAX)):

1987 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It
1988 contains the client supplied document name. The document name MAY be different than the Job
1989 name. It might be helpful, but NEED NOT be unique across multiple documents in the same Job.
1990 Typically, the client software automatically supplies the document name on behalf of the end user
1991 by using a file name or an application generated name. See the description of the "document-name"
1992 operation attribute in the Print-Job Request (section 3.2.1.1) for more information about this
1993 attribute.

1994

1995 "compression" (type3 keyword)

1996 See the description of "compression" for the Print-Job operation in Section 3.2.1.1.

1997

1998 "document-format" (mimeMediaType) :

1999 See the description of "document-format" for the Print-Job operation in Section 3.2.1.1. **Issue 11**

2000

2001 "document-natural-language" (naturalLanguage):

2002 The client **OPTIONALLY** supplies this attribute. The Printer object **OPTIONALLY** supports this
2003 attribute. This attribute specifies the natural language of the document for those document-formats
2004 that require a specification of the natural language in order to image the document unambiguously.
2005 There are no particular values required for the Printer object to support.

2006

2007

2008 "last-document" (boolean):

2009 The client **MUST** supply this attribute. The Printer object **MUST** support this attribute. It is a
2010 boolean flag that is set to 'true' if this is the last document for the Job, 'false' otherwise.

2011

2012 Group 2: Document Content

2013 The client **MUST** supply the document data if the "last-document" flag is set to 'false'. However,
2014 since a client might not know that the previous document sent with a Send-Document (or Send-
2015 URI) operation was the last document (i.e., the "last-document" attribute was set to 'false'), it is legal
2016 to send a Send-Document request with no document data where the "last-document" flag is set to
2017 'true'. Such a request **MUST NOT** increment the value of the Job object's "number-of-documents"
2018 attribute, since no real document was added to the job.

2019 3.3.1.2 Send-Document Response

2020 The following sets of attributes are part of the Send-Document Response:

2021 Group 1: Operation Attributes

2022 Status Message:

2023 In addition to the **REQUIRED** status code returned in every response, the response **OPTIONALLY**
2024 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

2025

2026 Natural Language and Character Set:

2027 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

2028

2029 Group 2: Unsupported Attributes

2030 See section 3.1.7 for details on returning Unsupported Attributes.

2031 Group 3: Job Object Attributes

2032 This is the same set of attributes as described in the Print-Job response (see section 3.2.1.2).

2033

2034 3.3.2 Send-URI Operation

2035 This OPTIONAL operation is identical to the Send-Document operation (see section 3.3.1) except that a
 2036 client MUST supply a URI reference ("document-uri" operation attribute) rather than the document data
 2037 itself. If a Printer object supports this operation, clients can use both Send-URI or Send-Document
 2038 operations to add new documents to an existing multi-document Job object. However, if a client needs to
 2039 indicate that the previous Send-URI or Send-Document was the last document, the client MUST use the
 2040 Send-Document operation with no document data and the "last-document" flag set to 'true' (rather than
 2041 using a Send-URI operation with no "document-uri" operation attribute).

2042 If a Printer object supports this operation, it MUST also support the Print-URI operation (see section 3.2.2).

2043 The Printer object MUST validate the syntax and URI scheme of the supplied URI before returning a
 2044 response, just as in the Print-URI operation. The IPP Printer MAY validate the accessibility of the
 2045 document as part of the operation or subsequently (see section 3.2.2). **Issue 35**

2046 3.3.3 Cancel-Job Operation

2047 This REQUIRED operation allows a client to cancel a Print Job from the time the job is created up to the
 2048 time it is completed, canceled, or aborted. Since a Job might already be printing by the time a Cancel-Job is
 2049 received, some media sheet pages might be printed before the job is actually terminated.

2050 The IPP object MUST accept or reject the request based on the job's current state and transition the job to
 2051 the indicated new state as follows:

Current "job-state"	New "job-state"	IPP object's response status code and action:
'pending'	'canceled'	'successful-ok'
'pending-held'	'canceled'	'successful-ok'
'processing'	'canceled'	'successful-ok'
'processing'	'processing'	'successful-ok' See Rule 1
'processing'	'processing'	'client-error-not-possible' See Rule 2
'processing-stopped'	'canceled'	'successful-ok'
'processing-stopped'	'processing-stopped'	'successful-ok' See Rule 1
'processing-stopped'	'processing-stopped'	'client-error-not-possible' See Rule 2
'completed'	'completed'	'client-error-not-possible'
'canceled'	'canceled'	'client-error-not-possible'
'aborted'	'aborted'	'client-error-not-possible'

2052 Rule 1: If the implementation requires some measurable time to cancel the job in the 'processing' or
 2053 'processing-stopped' job states, the IPP object MUST add the 'processing-to-stop-point' value to the job's
 2054 "job-state-reasons" attribute and then transition the job to the 'canceled' state when the processing ceases
 2055 (see section 4.3.8).

2056 Rule 2: If the Job object already has the 'processing-to-stop-point' value in its "job-state-reasons" attribute,
 2057 then the Printer object MUST reject a Cancel-Job operation.

2058 *Access Rights:* The authenticated user (see section 8.3) performing this operation must either be the job
2059 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP
2060 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or
2061 'client-error-not-authorized' as appropriate.

2062 3.3.3.1 Cancel-Job Request

2063 The following groups of attributes are part of the Cancel-Job Request:

2064 Group 1: Operation Attributes

2065 Natural Language and Character Set:

2066 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

2067

2068 Target:

2069 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation
2070 attribute(s) which define the target for this operation as described in section 3.1.5.

2071

2072 Requesting User Name:

2073 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as
2074 described in section 8.3.

2075

2076 "message" (text(127)):

2077 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this
2078 attribute. It is a message to the operator. This "message" attribute is not the same as the "job-
2079 message-from-operator" attribute. That attribute is used to report a message from the operator to the
2080 end user that queries that attribute. This "message" operation attribute is used to send a message
2081 from the client to the operator along with the operation request. It is an implementation decision of
2082 how or where to display this message to the operator (if at all).

2083

2084 3.3.3.2 Cancel-Job Response

2085 The following sets of attributes are part of the Cancel-Job Response:

2086 Group 1: Operation Attributes

2087 Status Message:

2088 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY
2089 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

2090

2091 Natural Language and Character Set:

2092 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

2093

2094 Group 2: Unsupported Attributes

2095 See section 3.1.7 for details on returning Unsupported Attributes.

2096

2097 Once a successful response has been sent, the implementation guarantees that the Job will eventually end up
2098 in the 'canceled' state. Between the time of the Cancel-Job operation is accepted and when the job enters the
2099 'canceled' job-state (see section 4.3.7), the "job-state-reasons" attribute SHOULD contain the 'processing-to-
2100 stop-point' value which indicates to later queries that although the Job might still be 'processing', it will
2101 eventually end up in the 'canceled' state, not the 'completed' state.

2102 3.3.4 Get-Job-Attributes Operation

2103 This REQUIRED operation allows a client to request the values of attributes of a Job object and it is almost
2104 identical to the Get-Printer-Attributes operation (see section 3.2.5). The only differences are that the
2105 operation is directed at a Job object rather than a Printer object, there is no "document-format" operation
2106 attribute used when querying a Job object, and the returned attribute group is a set of Job object attributes
2107 rather than a set of Printer object attributes.

2108 For Jobs, the possible names of attribute groups are:

- 2109 - 'job-template': the subset of the Job Template attributes that apply to a Job object (the first column of
2110 the table in Section 4.2) that the implementation supports for Job objects.
- 2111 - 'job-description': the subset of the Job Description attributes specified in Section 4.3 that the
2112 implementation supports for Job objects.
- 2113 - 'all': the special group 'all' that includes all attributes that the implementation supports for Job objects.

2114 **Issue 23**

2115

2116 Since a client MAY request specific attributes or named groups, there is a potential that there is some
2117 overlap. For example, if a client requests, 'job-name' and 'job-description', the client is actually requesting
2118 the "job-name" attribute once by naming it explicitly, and once by inclusion in the 'job-description' group.
2119 In such cases, the Printer object NEED NOT return the attribute only once in the response even if it is
2120 requested multiple times. The client SHOULD NOT request the same attribute in multiple ways.

2121 It is NOT REQUIRED that a Job object support all attributes belonging to a group (since some attributes
2122 are OPTIONAL). However it is REQUIRED that each Job object support all group names.

2123 3.3.4.1 Get-Job-Attributes Request

2124 The following groups of attributes are part of the Get-Job-Attributes Request when the request is directed at
2125 a Job object:

2126 Group 1: Operation Attributes

2127 Natural Language and Character Set:

2128 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

2129

2130 Target:
2131 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation
2132 attribute(s) which define the target for this operation as described in section 3.1.5.
2133

2134 Requesting User Name:
2135 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as
2136 described in section 8.3.
2137

2138 "requested-attributes" (1setOf keyword) :
2139 The client OPTIONALLY supplies this attribute. The IPP object MUST support this attribute. It is
2140 a set of attribute names and/or attribute group names in whose values the requester is interested. If
2141 the client omits this attribute, the IPP object MUST respond as if this attribute had been supplied
2142 with a value of 'all'.
2143

2144 3.3.4.2 Get-Job-Attributes Response

2145 The Printer object returns the following sets of attributes as part of the Get-Job-Attributes Response:

2146 Group 1: Operation Attributes

2147 Status Message:
2148 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY
2149 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.
2150

2151 Natural Language and Character Set:

2152 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.
2153 The "attributes-natural-language" MAY be the natural language of the Job object, rather than the
2154 one requested.
2155

2156 Group 2: Unsupported Attributes

2157 See section 3.1.7 for details on returning Unsupported Attributes.
2158

2159 The response NEED NOT contain the "requested-attributes" operation attribute with any supplied
2160 values (attribute keywords) that were requested by the client but are not supported by the IPP object.
2161 If the Printer object does include unsupported attributes referenced in "requested-attributes" and
2162 such attributes include group names, such as 'all', the unsupported attributes MUST NOT include
2163 attributes described in the standard but not supported by the implementation. **Issue 23**
2164

2165 Group 3: Job Object Attributes

2166 This is the set of requested attributes and their current values. The IPP object ignores (does not
2167 respond with) any requested attribute or value which is not supported or which is restricted by the
2168 security policy in force, including whether the requesting user is the user that submitted the job (job
2169 originating user) or not (see section 8). However, the IPP object MUST respond with the 'unknown'

2170 value for any supported attribute (including all REQUIRED attributes) for which the IPP object does
 2171 not know the value, unless it would violate the security policy. See the description of the "out-of-
 2172 band" values in the beginning of Section 4.1.

2173 3.3.5 Hold-Job Operation

2174 This OPTIONAL operation allows a client to hold a pending job in the queue so that it is not eligible for
 2175 scheduling. If the Hold-Job operation is supported, then the Release-Job operation MUST be supported,
 2176 and vice-versa. The OPTIONAL "job-hold-until" operation attribute allows a client to specify whether to
 2177 hold the job indefinitely or until a specified time period, if supported.

2178 The IPP object MUST accept or reject the request based on the job's current state and transition the job to
 2179 the indicated new state as follows:

Current "job-state"	New "job-state"	IPP object's response status code and action:
'pending'	'pending-held'	'successful-ok' See Rule 1
'pending'	'pending'	'successful-ok' See Rule 2
'pending-held'	'pending-held'	'successful-ok' See Rule 1
'pending-held'	'pending'	'successful-ok' See Rule 2
'processing'	'processing'	'client-error-not-possible'
'processing-stopped'	'processing-stopped'	'client-error-not-possible'
'completed'	'completed'	'client-error-not-possible'
'canceled'	'canceled'	'client-error-not-possible'
'aborted'	'aborted'	'client-error-not-possible'

2180 Rule 1: If the implementation supports multiple reasons for a job to be in the 'pending-held' state, the IPP
 2181 object MUST add the 'job-hold-until-specified' value to the job's "job-state-reasons" attribute.

2182 Rule 2: If the IPP object supports the "job-hold-until" operation attribute, but the specified time period has
 2183 already started (or is the 'no-hold' value) and there are no other reasons to hold the job, the IPP object
 2184 MUST make the job be a candidate for processing immediately (see Section 4.2.2) by putting the job in the
 2185 'pending' state.

2186 Note: In order to keep the Hold-Job operation simple, such a request is rejected when the job is in the
 2187 'processing' or 'processing-stopped' states. If an operation is needed to hold jobs while in these states, it will
 2188 be added as an additional operation, rather than overloading the Hold-Job operation. Then it is clear to
 2189 clients by querying the Printer object's "operations-supported" (see Section 4.4.15) and the Job object's
 2190 "job-state" (see Section 4.3.7) attributes which operations are possible.

2191 *Access Rights:* The authenticated user (see section 8.3) performing this operation must either be the job
 2192 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP
 2193 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or
 2194 'client-error-not-authorized' as appropriate.

2195 3.3.5.1 Hold-Job Request

2196 The groups and operation attributes are the same as for a Cancel-Job request (see section 3.3.3.1), with the
2197 addition of the following Group 1 Operation attribute:

2198 "job-hold-until" (type3 keyword | name(MAX)):

2199 The client OPTIONALLY supplies this Operation attribute. The IPP object MUST support this
2200 operation attribute in a Hold-Job request, if it supports the "job-hold-until" Job template attribute in
2201 create operations. See section 4.2.2. The IPP object SHOULD support the "job-hold-until" Job
2202 Template attribute for use in job create operations with at least the 'indefinite' value, if it supports
2203 the Hold-Job operation. Otherwise, a client cannot create a job and hold it immediately (without
2204 picking some supported time period in the future).

2205 If supplied and supported as specified in the Printer's "job-hold-until-supported" attribute, the IPP
2206 object copies the supplied operation attribute to the Job object, replacing the job's previous "job-
2207 hold-until" attribute, if present, and makes the job a candidate for scheduling during the supplied
2208 named time period.

2209 If supplied, but either the "job-hold-until" Operation attribute itself or the value supplied is not
2210 supported, the IPP object accepts the request, returns the unsupported attribute or value in the
2211 Unsupported Attributes Group according to section 3.1.7, returns the 'successful-ok-ignored-or-
2212 substituted-attributes, and holds the job indefinitely until a client performs a subsequent Release-Job
2213 operation.

2214 If the client (1) supplies a value that specifies a time period that has already started or the 'no-hold'
2215 value (meaning don't hold the job) and (2) the IPP object supports the "job-hold-until" operation
2216 attribute and there are no other reasons to hold the job, the IPP object MUST accept the operation
2217 and make the job be a candidate for processing immediately (see Section 4.2.2).

2218 If the client does not supply a "job-hold-until" Operation attribute in the request, the IPP object
2219 MUST populate the job object with a "job-hold-until" attribute with the 'indefinite' value (if IPP
2220 object supports the "job-hold-until" attribute) and hold the job indefinitely, until a client performs a
2221 Release-Job operation.

2222 3.3.5.2 Hold-Job Response

2223 The groups and attributes are the same as for a Cancel-Job response (see section 3.3.3.2).

2224 3.3.6 Release-Job Operation

2225 This OPTIONAL operation allows a client to release a previously held job so that it is again eligible for
2226 scheduling. If the Hold-Job operation is supported, then the Release-Job operation MUST be supported,
2227 and vice-versa.

2228 This operation removes the "job-hold-until" job attribute, if present, from the job object that had been
2229 supplied in the create or most recent Hold-Job or Restart-Job operation and remove its effect on the job.

2230 **Issue 30** The IPP object MUST remove the 'job-hold-until-specified' value from the job's "job-state-
2231 reasons" attribute, if present. See section 4.3.8.

2232 The IPP object MUST accept or reject the request based on the job's current state and transition the job to
2233 the indicated new state as follows:

Current "job-state"	New "job-state"	IPP object's response status code and action:
'pending'	'pending'	'successful-ok' No effect on the job.
'pending-held'	'pending-held'	'successful-ok' See Rule 1
'pending-held'	'pending'	'successful-ok'
'processing'	'processing'	'successful-ok' No effect on the job.
'processing-stopped'	'processing-stopped'	'successful-ok' No effect on the job.
'completed'	'completed'	'client-error-not-possible'
'canceled'	'canceled'	'client-error-not-possible'
'aborted'	'aborted'	'client-error-not-possible'

2234 Rule 1: If there are other reasons to keep the job in the 'pending-held' state, such as 'resources-are-not-
2235 ready', the job remains in the 'pending-held' state. Thus the 'pending-held' state is not just for jobs that have
2236 the 'job-hold-until' applied to them, but are for any reason to keep the job from being a candidate for
2237 scheduling and processing, such as 'resources-are-not-ready'. See the "job-hold-until" attribute (section
2238 4.2.2).

2239 *Access Rights:* The authenticated user (see section 8.3) performing this operation must either be the job
2240 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP
2241 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or
2242 'client-error-not-authorized' as appropriate.

2243 The Release-Job Request and Release-Job Response have the same attribute groups and attributes as the
2244 Cancel-Job operation (see section 3.3.3.1 and 3.3.3.2).

2245 3.3.7 Restart-Job Operation

2246 This OPTIONAL operation allows a client to restart a job that is retained in the queue after processing has
2247 completed (see section 4.3.7.2).

2248 The job is moved to the 'pending' job state and restarts at the beginning on the same IPP Printer object with
2249 the same attribute values. The Job Description attributes that accumulate job progress, such as "job-
2250 impressions-completed", "job-media-sheets-completed", and "job-k-octets-processed", MUST be reset to 0
2251 so that they give an accurate record of the job from its restart point. The job object MUST continue to use
2252 the same "job-uri" and "job-id" attribute values.

2253 Note: If in the future an operation is needed that does not reset the job progress attributes, then a new
2254 operation will be defined which makes a copy of the job, assigns a new "job-uri" and "job-id" to the copy
2255 and resets the job progress attributes in the new copy only.

2256 The IPP object **MUST** accept or reject the request based on the job's current state, transition the job to the
2257 indicated new state as follows:

Current "job-state"	New "job-state"	IPP object's response status code and action:
'pending'	'pending'	'client-error-not-possible'.
'pending-held'	'pending-held'	'client-error-not-possible'.
'processing'	'processing'	'client-error-not-possible'.
'processing-stopped'	'processing-stopped'	'client-error-not-possible'.
'completed'	'pending'	'successful-ok' - job is started over.
'completed'	'completed'	'client-error-not-possible' - see Rule 1
'canceled'	'pending'	'successful-ok' - job is started over.
'canceled'	'canceled'	'client-error-not-possible' - see Rule 1
'aborted'	'pending'	'successful-ok' - job is started over.
'aborted'	'aborted'	'client-error-not-possible' - see Rule 1

2258

2259 Rule 1: If the Job Retention Period has expired for the job in this state, then the IPP object rejects the
2260 operation. See section 4.3.7.2.

2261 Note: In order to prevent a user from inadvertently restarting a job in the middle, the Restart-Job request is
2262 rejected when the job is in the 'processing' or 'processing-stopped' states. If in the future an operation is
2263 needed to hold or restart jobs while in these states, it will be added as an additional operation, rather than
2264 overloading the Restart-Job operation, so that it is clear that the user intended that the current job not be
2265 completed.

2266 *Access Rights:* The authenticated user (see section 8.3) performing this operation must either be the job
2267 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP
2268 object **MUST** reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or
2269 'client-error-not-authorized' as appropriate.

2270 3.3.7.1 Restart-Job Request

2271 The groups and attributes are the same as for a Cancel-Job request (see section 3.3.3.1), with the addition of
2272 the following Group 1 Operation attribute:

2273 "job-hold-until" (type3 keyword | name(MAX)):

2274 The client **OPTIONALLY** supplies this attribute. The IPP object **MUST** support this Operation
2275 attribute in a Restart-Job request, if it supports the "job-hold-until" Job Template attribute in create
2276 operations. See section 4.2.2. Otherwise, the IPP object **NEED NOT** support the "job-hold-until"
2277 Operation attribute in a Restart-Job request.

2278 If supplied and supported as specified in the Printer's "job-hold-until-supported" attribute, the IPP
2279 object copies the supplied Operation attribute to the Job object, replacing the job's previous "job-
2280 hold-until" attribute, if present, and makes the job a candidate for scheduling during the supplied
2281 named time period. See section 4.2.2.

2282 If supplied, but the value is not supported, the IPP object accepts the request, returns the
2283 unsupported attribute or value in the Unsupported Attributes Group according to section 3.1.7,
2284 returns the 'successful-ok-ignored-or-substituted-attributes' status code, and holds the job
2285 indefinitely until a client performs a subsequent Release-Job operation.

2286 If supplied, but the "job-hold-until" Operation attribute itself is not supported, the IPP object accepts
2287 the request, returns the unsupported attribute with the out-of-band 'unsupported' value in the
2288 Unsupported Attributes Group according to section 3.1.7, returns the 'successful-ok-ignored-or-
2289 substituted-attributes' status code, and restarts the job, i.e., ignores the "job-hold-until" attribute.

2290 If the client (1) supplies a value that specifies a time period that has already started or the 'no-hold'
2291 value (meaning don't hold the job) and (2) the IPP object supports the "job-hold-until" operation
2292 attribute and there are no other reasons to hold the job, the IPP object makes the job a candidate for
2293 processing immediately (see Section 4.2.2).

2294 If the client does not supply a "job-hold-until" operation attribute in the request, the IPP object
2295 removes the "job-hold-until" attribute, if present, from the job. If there are no other reasons to hold
2296 the job, the Restart-Job operation makes the job a candidate for processing immediately (see Section
2297 4.2.2).

2298 3.3.7.2 Restart-Job Response

2299 The groups and attributes are the same as for a Cancel-Job response (see section 3.3.3.2).

2300 Note: In the future an OPTIONAL Modify-Job or Set-Job-Attributes operation may be specified that
2301 allows the client to modify other attributes before releasing the restarted job.

2302 4. Object Attributes

2303 This section describes the attributes with their corresponding attribute syntaxes and values that are part of
2304 the IPP model. The sections below show the objects and their associated attributes which are included
2305 within the scope of this protocol. Many of these attributes are derived from other relevant documents:

2306 - Document Printing Application (DPA) [ISO10175]

2307 - RFC 1759 Printer MIB [RFC1759]

2308

2309 Each attribute is uniquely identified in this document using a "keyword" (see section 12.2.1) which is the
2310 name of the attribute. The keyword is included in the section header describing that attribute.

2311 Note: Not only are keywords used to identify attributes, but one of the attribute syntaxes described below is
2312 "keyword" so that some attributes have keyword values. Therefore, these attributes are defined as having
2313 an attribute syntax that is a set of keywords.

2314 4.1 Attribute Syntaxes

2315 This section defines the basic attribute syntax types that all clients and IPP objects **MUST** be able to accept
2316 in responses and accept in requests, respectively. Each attribute description in sections 3 and 4 includes the
2317 name of attribute syntax(es) in the heading (in parentheses). A conforming implementation of an attribute
2318 **MUST** include the semantics of the attribute syntax(es) so identified. Section 6.3 describes how the
2319 protocol can be extended with new attribute syntaxes.

2320 The attribute syntaxes are specified in the following sub-sections, where the sub-section heading is the
2321 keyword name of the attribute syntax inside the single quotes. In operation requests and responses each
2322 attribute value **MUST** be represented as one of the attribute syntaxes specified in the sub-section heading
2323 for the attribute. In addition, the value of an attribute in a response (but not in a request) **MAY** be one of
2324 the "out-of-band" values whose special encoding rules are defined in the "Encoding and Transport"
2325 document [IPP-PRO]. Standard "out-of-band" values are: **Issue 12 and Issue 15**

2326 'unknown': The attribute is supported by the IPP object, but the value is unknown to the IPP object for
2327 some reason.

2328 'unsupported': The attribute is unsupported by the IPP object. This value **MUST** be returned only as the
2329 value of an attribute in the Unsupported Attributes Group.

2330 'no-value': The attribute is supported by the Printer object, but the administrator has not yet configured a
2331 value.

2332

2333 All attributes in a request **MUST** have one or more values as defined in Sections 4.2 to 4.4. Thus clients
2334 **MUST NOT** supply attributes with "out-of-band" values. All attributes in a response **MUST** have one or
2335 more values as defined in Sections 4.2 to 4.4 or a single "out-of-band" value.

2336 Most attributes are defined to have a single attribute syntax. However, a few attributes (e.g., "job-sheet",
2337 "media", "job-hold-until") are defined to have several attribute syntaxes, depending on the value. These
2338 multiple attribute syntaxes are separated by the "|" character in the sub-section heading to indicate the
2339 choice. Since each value **MUST** be tagged as to its attribute syntax in the protocol, a single-valued attribute
2340 instance may have any one of its attribute syntaxes and a multi-valued attribute instance may have a mixture
2341 of its defined attribute syntaxes.

2342 4.1.1 'text'

2343 A text attribute is an attribute whose value is a sequence of zero or more characters encoded in a maximum
2344 of 1023 ('MAX') octets. MAX is the maximum length for each value of any text attribute. However, if an
2345 attribute will always contain values whose maximum length is much less than MAX, the definition of that
2346 attribute will include a qualifier that defines the maximum length for values of that attribute. For example:
2347 the "printer-location" attribute is specified as "printer-location (text(127))". In this case, text values for
2348 "printer-location" **MUST NOT** exceed 127 octets; if supplied with a longer text string via some external
2349 interface (other than the protocol), implementations are free to truncate to this shorter length limitation.

2350 In this document, all text attributes are defined using the 'text' syntax. However, 'text' is used only for
2351 brevity; the formal interpretation of 'text' is: 'textWithoutLanguage | textWithLanguage'. That is, for any

2352 attribute defined in this document using the `text` attribute syntax, all IPP objects and clients MUST support
2353 both the `textWithoutLanguage` and `textWithLanguage` attribute syntaxes. However, in actual usage and
2354 protocol execution, objects and clients accept and return only one of the two syntax per attribute. The
2355 syntax `text` never appears "on-the-wire".

2356 Both `textWithoutLanguage` and `textWithLanguage` are needed to support the real world needs of
2357 interoperability between sites and systems that use different natural languages as the basis for human
2358 communication. Generally, one natural language applies to all text attributes in a given request or response.
2359 The language is indicated by the "attributes-natural-language" operation attribute defined in section 3.1.4 or
2360 "attributes-natural-language" job attribute defined in section 4.3.20, and there is no need to identify the
2361 natural language for each text string on a value-by-value basis. In these cases, the attribute syntax
2362 `textWithoutLanguage` is used for text attributes. In other cases, the client needs to supply or the Printer
2363 object needs to return a text value in a natural language that is different from the rest of the text values in
2364 the request or response. In these cases, the client or Printer object uses the attribute syntax
2365 `textWithLanguage` for text attributes (this is the Natural Language Override mechanism described in
2366 section 3.1.4).

2367 The `textWithoutLanguage` and `textWithLanguage` attribute syntaxes are described in more detail in the
2368 following sections.

2369 4.1.1.1 `textWithoutLanguage`

2370 The `textWithoutLanguage` syntax indicates a value that is sequence of zero or more characters. Text
2371 strings are encoded using the rules of some charset. The Printer object MUST support the UTF-8 charset
2372 [RFC2279] and MAY support additional charsets to represent `text` values, provided that the charsets are
2373 registered with IANA [IANA-CS]. See Section 4.1.7 for the definition of the `charset` attribute syntax,
2374 including restricted semantics and examples of charsets.

2375 4.1.1.2 `textWithLanguage`

2376 The `textWithLanguage` attribute syntax is a compound attribute syntax consisting of two parts: a
2377 `textWithoutLanguage` part plus an additional `naturalLanguage` (see section 4.1.8) part that overrides the
2378 natural language in force. The `naturalLanguage` part explicitly identifies the natural language that applies
2379 to the text part of that value and that value alone. For any give text attribute, the `textWithoutLanguage` part
2380 is limited to the maximum length defined for that attribute, but the `naturalLanguage` part is always limited
2381 to 63 octets. Using the `textWithLanguage` attribute syntax rather than the normal `textWithoutLanguage`
2382 syntax is the so-called Natural Language Override mechanism and MUST be supported by all IPP objects
2383 and clients.

2384 If the attribute is multi-valued (1setOf text), then the `textWithLanguage` attribute syntax MUST be used to
2385 explicitly specify each attribute value whose natural language needs to be overridden. Other values in a
2386 multi-valued `text` attribute in a request or a response revert to the natural language of the operation
2387 attribute.

2388 In a create request, the Printer object MUST accept and store with the Job object any natural language in the
2389 "attributes-natural-language" operation attribute, whether the Printer object supports that natural language

2390 or not. Furthermore, the Printer object MUST accept and store any `textWithLanguage` attribute value,
2391 whether the Printer object supports that natural language or not. These requirements are independent of the
2392 value of the "ipp-attribute-fidelity" operation attribute that the client MAY supply.

2393 Example: If the client supplies the "attributes-natural-language" operation attribute with the value: `en`
2394 indicating English, but the value of the "job-name" attribute is in French, the client MUST use the
2395 `textWithLanguage` attribute syntax with the following two values:

2396 `fr`: Natural Language Override indicating French
2397 `Rapport Mensuel`: the job name in French
2398

2399 See the "Encoding and Transport" document [IPP-PRO] for a detailed example of the `textWithLanguage`
2400 attribute syntax.

2401 4.1.2 `name`

2402 This syntax type is used for user-friendly strings, such as a Printer name, that, for humans, are more
2403 meaningful than identifiers. Names are never translated from one natural language to another. The `name`
2404 attribute syntax is essentially the same as `text`, including the REQUIRED support of UTF-8 except that the
2405 sequence of characters is limited so that its encoded form MUST NOT exceed 255 (MAX) octets.

2406 Also like `text`, `name` is really an abbreviated notation for either `nameWithoutLanguage` or
2407 `nameWithLanguage`. That is, all IPP objects and clients MUST support both the `nameWithoutLanguage`
2408 and `nameWithLanguage` attribute syntaxes. However, in actual usage and protocol execution, objects and
2409 clients accept and return only one of the two syntax per attribute. The syntax `name` never appears "on-the-
2410 wire".

2411 Only the `text` and `name` attribute syntaxes permit the Natural Language Override mechanism.

2412 Some attributes are defined as `type3 keyword | name`. These attributes support values that are either type3
2413 keywords or names. This dual-syntax mechanism enables a site administrator to extend these attributes to
2414 legally include values that are locally defined by the site administrator. Such names are not registered with
2415 IANA.

2416 4.1.2.1 `nameWithoutLanguage`

2417 The `nameWithoutLanguage` syntax indicates a value that is sequence of zero or more characters so that its
2418 encoded form does not exceed MAX octets.

2419 4.1.2.2 `nameWithLanguage`

2420 The `nameWithLanguage` attribute syntax is a compound attribute syntax consisting of two parts: a
2421 `nameWithoutLanguage` part plus an additional `naturalLanguage` (see section 4.1.8) part that overrides the
2422 natural language in force. The `naturalLanguage` part explicitly identifies the natural language that applies
2423 to that name value and that name value alone.

2424 The 'nameWithLanguage' attribute syntax behaves the same as the 'textWithLanguage' syntax. If a name is
2425 in a language that is different than the rest of the object or operation, then this 'nameWithLanguage' syntax
2426 is used rather than the generic 'nameWithoutLanguage' syntax.

2427 Example: If the client supplies the "attributes-natural-language" operation attribute with the value: 'en'
2428 indicating English, but the "printer-name" attribute is in German, the client MUST use the
2429 'nameWithLanguage' attribute syntax as follows:

2430 'de': Natural Language Override indicating German
2431 'Farbdrucker': the Printer name in German
2432

2433 4.1.2.3 Matching 'name' attribute values

2434 For purposes of matching two 'name' attribute values for equality, such as in job validation (where a client-
2435 supplied value for attribute "xxx" is checked to see if the value is among the values of the Printer object's
2436 corresponding "xxx-supported" attribute), the following match rules apply:

2437 1. 'keyword' values never match 'name' values.

2438 2. 'name' (nameWithoutLanguage and nameWithLanguage) values match if (1) the name parts
2439 match and (2) the Associated Natural-Language parts (see section 3.1.4.1) match. The matching
2440 rules are:

2441 a. the name parts match if the two names are identical character by character, except it is
2442 RECOMMENDED that case be ignored. For example: 'Ajax-letter-head-white' MUST
2443 match 'Ajax-letter-head-white' and SHOULD match 'ajax-letter-head-white' and 'AJAX-
2444 LETTER-HEAD-WHITE'.

2445 b. the Associated Natural-Language parts match if the shorter of the two meets the syntactic
2446 requirements of RFC 1766 [RFC1766] and matches byte for byte with the longer. For
2447 example, 'en' matches 'en', 'en-us' and 'en-gb', but matches neither 'fr' nor 'e'.

2448 4.1.3 'keyword'

2449 The 'keyword' attribute syntax is a sequence of characters, length: 1 to 255, containing only the US-ASCII
2450 [ASCII] encoded values for lowercase letters ("a" - "z"), digits ("0" - "9"), hyphen ("-"), dot ("."), and
2451 underscore ("_"). The first character MUST be a lowercase letter. Furthermore, keywords MUST be in
2452 U.S. English.

2453 This syntax type is used for enumerating semantic identifiers of entities in the abstract protocol, i.e., entities
2454 identified in this document. Keywords are used as attribute names or values of attributes. Unlike 'text' and
2455 'name' attribute values, 'keyword' values MUST NOT use the Natural Language Override mechanism, since
2456 they MUST always be US-ASCII and U.S. English.

2457 Keywords are for use in the protocol. A user interface will likely provide a mapping between protocol
2458 keywords and displayable user-friendly words and phrases which are localized to the natural language of

2459 the user. While the keywords specified in this document MAY be displayed to users whose natural
2460 language is U.S. English, they MAY be mapped to other U.S. English words for U.S. English users, since
2461 the user interface is outside the scope of this document.

2462 In the definition for each attribute of this syntax type, the full set of defined keyword values for that
2463 attribute are listed.

2464 When a keyword is used to represent an attribute (its name), it MUST be unique within the full scope of all
2465 IPP objects and attributes. When a keyword is used to represent a value of an attribute, it MUST be unique
2466 just within the scope of that attribute. That is, the same keyword MUST NOT be used for two different
2467 values within the same attribute to mean two different semantic ideas. However, the same keyword MAY
2468 be used across two or more attributes, representing different semantic ideas for each attribute. Section 6.1
2469 describes how the protocol can be extended with new keyword values. Examples of attribute name
2470 keywords:

2471 "job-name"

2472 "attributes-charset"

2473

2474 Note: This document uses "type1", "type2", and "type3" prefixes to the "keyword" basic syntax to indicate
2475 different levels of review for extensions (see section 6.1).

2476 4.1.4 'enum'

2477 The 'enum' attribute syntax is an enumerated integer value that is in the range from 1 to $2^{*}31 - 1$ (MAX).
2478 Each value has an associated 'keyword' name. In the definition for each attribute of this syntax type, the full
2479 set of possible values for that attribute are listed. This syntax type is used for attributes for which there are
2480 enum values assigned by other standards, such as SNMP MIBs. A number of attribute enum values in this
2481 document are also used for corresponding attributes in other standards [RFC1759]. This syntax type is not
2482 used for attributes to which the administrator may assign values. Section 6.1 describes how the protocol
2483 can be extended with new enum values.

2484 Enum values are for use in the protocol. A user interface will provide a mapping between protocol enum
2485 values and displayable user-friendly words and phrases which are localized to the natural language of the
2486 user. While the enum symbols specified in this document MAY be displayed to users whose natural
2487 language is U.S. English, they MAY be mapped to other U.S. English words for U.S. English users, since
2488 the user interface is outside the scope of this document.

2489 Note: SNMP MIBs use '2' for 'unknown' which corresponds to the IPP "out-of-band" value 'unknown'. See
2490 the description of the "out-of-band" values at the beginning of Section 4.1. Therefore, attributes of type
2491 'enum' start at '3'.

2492 Note: This document uses "type1", "type2", and "type3" prefixes to the "enum" basic syntax to indicate
2493 different levels of review for extensions (see section 6.1).

2494 4.1.5 'uri'

2495 The 'uri' attribute syntax is any valid Uniform Resource Identifier or URI [RFC2396]. Most often, URIs are
2496 simply Uniform Resource Locators or URLs. The maximum length of URIs used as values of IPP
2497 attributes is 1023 octets. Although most other IPP attribute syntax types allow for only lower-cased values,
2498 this attribute syntax type conforms to the case-sensitive and case-insensitive rules specified in [RFC2396].
2499 See also [IPP-IIG] for a discussion of case in URIs.

2500 4.1.6 'uriScheme'

2501 The 'uriScheme' attribute syntax is a sequence of characters representing a URI scheme according to RFC
2502 2396 [RFC2396]. Though RFC 2396 requires that the values be case-insensitive, IPP requires all lower
2503 case values in IPP attributes to simplify comparing by IPP clients and Printer objects.

2504 Standard values for this syntax type are the following keywords:

2505 'ipp': for IPP schemed URIs (e.g., "ipp:...")
2506 'http': for HTTP schemed URIs (e.g., "http:...")
2507 'https': for use with HTTPS schemed URIs (e.g., "https:...") (not on IETF standards track)
2508 'ftp': for FTP schemed URIs (e.g., "ftp:...")
2509 'mailto': for SMTP schemed URIs (e.g., "mailto:...")
2510 'file': for file schemed URIs (e.g., "file:...")
2511

2512 A Printer object MAY support any URI 'scheme' that has been registered with IANA [IANA-MT]. The
2513 maximum length of URI 'scheme' values used to represent IPP attribute values is 63 octets.

2514 4.1.7 'charset'

2515 The 'charset' attribute syntax is a standard identifier for a charset. A charset is a coded character set and
2516 encoding scheme. Charsets are used for labeling certain document contents and 'text' and 'name' attribute
2517 values. The syntax and semantics of this attribute syntax are specified in RFC 2046 [RFC2046] and
2518 contained in the IANA character-set Registry [IANA-CS] according to the IANA procedures [RFC2278].
2519 Though RFC 2046 requires that the values be case-insensitive US-ASCII, IPP requires all lower case values
2520 in IPP attributes to simplify comparing by IPP clients and Printer objects. When a character-set in the
2521 IANA registry has more than one name (alias), the name labeled as "(preferred MIME name)", if present,
2522 MUST be used.

2523 The maximum length of 'charset' values used to represent IPP attribute values is 63 octets.

2524 Some examples are:

2525 'utf-8': ISO 10646 Universal Multiple-Octet Coded Character Set (UCS) represented as the UTF-8
2526 [RFC2279] transfer encoding scheme in which US-ASCII is a subset charset.
2527 'us-ascii': 7-bit American Standard Code for Information Interchange (ASCII), ANSI X3.4-1986
2528 [ASCII]. That standard defines US-ASCII, but RFC 2045 [RFC2045] eliminates most of the control
2529 characters from conformant usage in MIME and IPP.

2530 `iso-8859-1`: 8-bit One-Byte Coded Character Set, Latin Alphabet Nr 1 [ISO8859-1]. That standard
2531 defines a coded character set that is used by Latin languages in the Western Hemisphere and
2532 Western Europe. US-ASCII is a subset charset.
2533 `iso-10646-ucs-2`: ISO 10646 Universal Multiple-Octet Coded Character Set (UCS) represented as two
2534 octets (UCS-2), with the high order octet of each pair coming first (so-called Big Endian integer).
2535

2536 Some attribute descriptions MAY place additional requirements on charset values that may be used, such as
2537 REQUIRED values that MUST be supported or additional restrictions, such as requiring that the charset
2538 have US-ASCII as a subset charset.

2539 4.1.8 `naturalLanguage`

2540 The `naturalLanguage` attribute syntax is a standard identifier for a natural language and optionally a
2541 country. The values for this syntax type are defined by RFC 1766 [RFC1766]. Though RFC 1766 requires
2542 that the values be case-insensitive US-ASCII, IPP requires all lower case to simplify comparing by IPP
2543 clients and Printer objects. Examples include:

2544 `en`: for English
2545 `en-us`: for US English
2546 `fr`: for French
2547 `de`: for German
2548

2549 The maximum length of `naturalLanguage` values used to represent IPP attribute values is 63 octets.

2550 4.1.9 `mimeMediaType`

2551 The `mimeMediaType` attribute syntax is the Internet Media Type (sometimes called MIME type) as
2552 defined by RFC 2046 [RFC2046] and registered according to the procedures of RFC 2048 [RFC2048] for
2553 identifying a document format. The value MAY include a charset parameter, depending on the
2554 specification of the Media Type in the IANA Registry [IANA-MT]. Although most other IPP syntax types
2555 allow for only lower-cased values, this syntax type allows for mixed-case values which are case-insensitive.

2556 Examples are:

2557 `text/html`: An HTML document
2558 `text/plain`: A plain text document in US-ASCII (RFC 2046 indicates that in the absence of the charset
2559 parameter MUST mean US-ASCII rather than simply unspecified) [RFC2046].
2560 `text/plain; charset=US-ASCII`: A plain text document in US-ASCII [52, 56].
2561 `text/plain; charset=ISO-8859-1`: A plain text document in ISO 8859-1 (Latin 1) [ISO8859-1].
2562 `text/plain; charset=utf-8`: A plain text document in ISO 10646 represented as UTF-8 [RFC2279]
2563 `application/postscript`: A PostScript document [RFC2046]
2564 `application/vnd.hp-PCL`: A PCL document [IANA-MT] (charset escape sequence embedded in the
2565 document data)
2566 `application/pdf`: Portable Document Format - see IANA MIME Media Type registry
2567 `application/octet-stream`: Auto-sense - see section 4.1.9.1

2568

2569 4.1.9.1 Application/octet-stream -- Auto-Sensing the document format

2570 One special type is 'application/octet-stream'. If the Printer object supports this value, the Printer object
2571 MUST be capable of auto-sensing the format of the document data, either as part of the create operation
2572 and/or at document processing time. During auto-sensing, a Printer may determine that the document-data
2573 has a format that the Printer doesn't recognize. If the Printer determines this problem before returning an
2574 operation response, it rejects the request and returns the 'client-error-document-format-not-supported' status
2575 code. If the Printer determines this problem after accepting the request and returning an operation response
2576 with one of the successful status codes, the Printer adds the 'unsupported-document-format' value to the
2577 job's "job-state-reasons" attribute. **Issue 9 and Issue 10**

2578 If the Printer object's default value attribute "document-format-default" is set to 'application/octet-stream',
2579 the Printer object not only supports auto-sensing of the document format, but will depend on the result of
2580 applying its auto-sensing when the client does not supply the "document-format" attribute. If the client
2581 supplies a document format value, the Printer MUST rely on the supplied attribute, rather than trust its
2582 auto-sensing algorithm. To summarize:

- 2583 1. If the client does not supply a document format value, the Printer MUST rely on its default value
2584 setting (which may be 'application/octet-stream' indicating an auto-sensing mechanism).
 - 2585 2. If the client supplies a value other than 'application/octet-stream', the client is supplying valid
2586 information about the format of the document data and the Printer object MUST trust the client
2587 supplied value more than the outcome of applying an automatic format detection mechanism. For
2588 example, the client may be requesting the printing of a PostScript file as a 'text/plain' document.
2589 The Printer object MUST print a text representation of the PostScript commands rather than
2590 interpret the stream of PostScript commands and print the result.
 - 2591 3. If the client supplies a value of 'application/octet-stream', the client is indicating that the Printer
2592 object MUST use its auto-sensing mechanism on the client supplied document data whether auto-
2593 sensing is the Printer object's default or not.
- 2594

2595 Note: Since the auto-sensing algorithm is probabilistic, if the client requests both auto-sensing ("document-
2596 format" set to 'application/octet-stream') and true fidelity ("ipp-attribute-fidelity" set to 'true'), the Printer
2597 object might not be able to guarantee exactly what the end user intended (the auto-sensing algorithm might
2598 mistake one document format for another), but it is able to guarantee that its auto-sensing mechanism be
2599 used.

2600 The maximum length of a 'mimeType' value to represent IPP attribute values is 255 octets.

2601 4.1.10 'octetString'

2602 The 'octetString' attribute syntax is a sequence of octets encoded in a maximum of 1023 octets which is
2603 indicated in sub-section headers using the notation: octetString(MAX). This syntax type is used for opaque
2604 data.

2605 4.1.11 'boolean'

2606 The 'boolean' attribute syntax has only two values: 'true' and 'false'.

2607 4.1.12 'integer'

2608 The 'integer' attribute syntax is an integer value that is in the range from -2^{31} (MIN) to $2^{31} - 1$ (MAX).
2609 Each individual attribute may specify the range constraint explicitly in sub-section headers if the range is
2610 different from the full range of possible integer values. For example: job-priority (integer(1:100)) for the
2611 "job-priority" attribute. However, the enforcement of that additional constraint is up to the IPP objects, not
2612 the protocol.

2613 4.1.13 'rangeOfInteger'

2614 The 'rangeOfInteger' attribute syntax is an ordered pair of integers that defines an inclusive range of integer
2615 values. The first integer specifies the lower bound and the second specifies the upper bound. If a range
2616 constraint is specified in the header description for an attribute in this document whose attribute syntax is
2617 'rangeOfInteger' (i.e., 'X:Y' indicating X as a minimum value and Y as a maximum value), then the
2618 constraint applies to both integers.

2619 4.1.14 'dateTime'

2620 The 'dateTime' attribute syntax is a standard, fixed length, 11 octet representation of the "DateAndTime"
2621 syntax as defined in RFC 2579 [RFC2579]. RFC 2579 also identifies an 8 octet representation of a
2622 "DateAndTime" value, but IPP objects MUST use the 11 octet representation. A user interface will provide
2623 a mapping between protocol dateTime values and displayable user-friendly words or presentation values
2624 and phrases which are localized to the natural language and date format of the user, including time zone.

2625 4.1.15 'resolution'

2626 The 'resolution' attribute syntax specifies a two-dimensional resolution in the indicated units. It consists of
2627 3 values: a cross feed direction resolution (positive integer value), a feed direction resolution (positive
2628 integer value), and a units value. The semantics of these three components are taken from the Printer MIB
2629 [RFC1759] suggested values. That is, the cross feed direction component resolution component is the same
2630 as the prtMarkerAddressabilityXFeedDir object in the Printer MIB, the feed direction component resolution
2631 component is the same as the prtMarkerAddressabilityFeedDir in the Printer MIB, and the units component
2632 is the same as the prtMarkerAddressabilityUnit object in the Printer MIB (namely, '3' indicates dots per inch
2633 and '4' indicates dots per centimeter). All three values MUST be present even if the first two values are the
2634 same. Example: '300', '600', '3' indicates a 300 dpi cross-feed direction resolution, a 600 dpi feed direction
2635 resolution, since a '3' indicates dots per inch (dpi).

2636 4.1.16 '1setOf X'

2637 The '1setOf X' attribute syntax is 1 or more values of attribute syntax type X. This syntax type is used for
2638 multi-valued attributes. The syntax type is called '1setOf' rather than just 'setOf' as a reminder that the set

2639 of values MUST NOT be empty (i.e., a set of size 0). Sets are normally unordered. However each attribute
2640 description of this type may specify that the values MUST be in a certain order for that attribute.

2641 4.2 Job Template Attributes

2642 Job Template attributes describe job processing behavior. Support for Job Template attributes by a Printer
2643 object is OPTIONAL (see section 12.2.3 for a description of support for OPTIONAL attributes). Also,
2644 clients OPTIONALLY supply Job Template attributes in create requests.

2645 Job Template attributes conform to the following rules. For each Job Template attribute called "xxx":

2646 1. If the Printer object supports "xxx" then it MUST support both a "xxx-default" attribute (unless there
2647 is a "No" in the table below) and a "xxx-supported" attribute. If the Printer object doesn't support
2648 "xxx", then it MUST support neither an "xxx-default" attribute nor an "xxx-supported" attribute,
2649 and it MUST treat an attribute "xxx" supplied by a client as unsupported. An attribute "xxx" may be
2650 supported for some document formats and not supported for other document formats. For example,
2651 it is expected that a Printer object would only support "orientation-requested" for some document
2652 formats (such as 'text/plain' or 'text/html') but not others (such as 'application/postscript').

2653

2654 2. "xxx" is OPTIONALLY supplied by the client in a create request. If "xxx" is supplied, the client is
2655 indicating a desired job processing behavior for this Job. When "xxx" is not supplied, the client is
2656 indicating that the Printer object apply its default job processing behavior at job processing time if
2657 the document content does not contain an embedded instruction indicating an xxx-related behavior.

2658

2659 Since an administrator MAY change the default value attribute after a Job object has been submitted
2660 but before it has been processed, the default value used by the Printer object at job processing time
2661 may be different than the default value in effect at job submission time.

2662

2663 3. The "xxx-supported" attribute is a Printer object attribute that describes which job processing
2664 behaviors are supported by that Printer object. A client can query the Printer object to find out what
2665 xxx-related behaviors are supported by inspecting the returned values of the "xxx-supported"
2666 attribute.

2667

2668 Note: The "xxx" in each "xxx-supported" attribute name is singular, even though an "xxx-
2669 supported" attribute usually has more than one value, such as "job-sheet-supported", unless the
2670 "xxx" Job Template attribute is plural, such as "finishings" or "sides". In such cases the "xxx-
2671 supported" attribute names are: "finishings-supported" and "sides-supported".

2672

2673 4. The "xxx-default" default value attribute describes what will be done at job processing time when no
2674 other job processing information is supplied by the client (either explicitly as an IPP attribute in the
2675 create request or implicitly as an embedded instruction within the document data).

2676

2677 If an application wishes to present an end user with a list of supported values from which to choose, the
2678 application SHOULD query the Printer object for its supported value attributes. The application SHOULD
2679 also query the default value attributes. If the application then limits selectable values to only those value

2680 that are supported, the application can guarantee that the values supplied by the client in the create request
2681 all fall within the set of supported values at the Printer. When querying the Printer, the client MAY
2682 enumerate each attribute by name in the Get-Printer-Attributes Request, or the client MAY just name the
2683 "job-template" group in order to get the complete set of supported attributes (both supported and default
2684 attributes).

2685 The "finishings" attribute is an example of a Job Template attribute. It can take on a set of values such as
2686 'staple', 'punch', and/or 'cover'. A client can query the Printer object for the "finishings-supported" attribute
2687 and the "finishings-default" attribute. The supported attribute contains a set of supported values. The
2688 default value attribute contains the finishing value(s) that will be used for a new Job if the client does not
2689 supply a "finishings" attribute in the create request and the document data does not contain any
2690 corresponding finishing instructions. If the client does supply the "finishings" attribute in the create
2691 request, the IPP object validates the value or values to make sure that they are a subset of the supported
2692 values identified in the Printer object's "finishings-supported" attribute. See section 3.1.7.

2693 The table below summarizes the names and relationships for all Job Template attributes. The first column
2694 of the table (labeled "Job Attribute") shows the name and syntax for each Job Template attribute in the Job
2695 object. These are the attributes that can optionally be supplied by the client in a create request. The last
2696 two columns (labeled "Printer: Default Value Attribute" and "Printer: Supported Values Attribute") shows
2697 the name and syntax for each Job Template attribute in the Printer object (the default value attribute and the
2698 supported values attribute). A "No" in the table means the Printer MUST NOT support the attribute (that is,
2699 the attribute is simply not applicable). For brevity in the table, the 'text' and 'name' entries do not show the
2700 maximum length for each attribute.

2701	+=====+		
2702	Job Attribute	Printer: Default Value	Printer: Supported

2762

2763

2764 4.2.1 job-priority (integer(1:100))

2765 This attribute specifies a priority for scheduling the Job. A higher value specifies a higher priority. The
 2766 value 1 indicates the lowest possible priority. The value 100 indicates the highest possible priority. Among
 2767 those jobs that are ready to print, a Printer **MUST** print all jobs with a priority value of n before printing
 2768 those with a priority value of n-1 for all n.

2769 If the Printer object supports this attribute, it **MUST** always support the full range from 1 to 100. No
 2770 administrative restrictions are permitted. This way an end-user can always make full use of the entire range
 2771 with any Printer object. If privileged jobs are implemented outside IPP/1.1, they **MUST** have priorities
 2772 higher than 100, rather than restricting the range available to end-users.

2773 If the client does not supply this attribute and this attribute is supported by the Printer object, the Printer
 2774 object **MUST** use the value of the Printer object's "job-priority-default" at job submission time (unlike most
 2775 Job Template attributes that are used if necessary at job processing time).

2776 The syntax for the "job-priority-supported" is also integer(1:100). This single integer value indicates the
 2777 number of priority levels supported. The Printer object **MUST** take the value supplied by the client and
 2778 map it to the closest integer in a sequence of n integers values that are evenly distributed over the range
 2779 from 1 to 100 using the formula:

2780
$$\text{roundToNearestInt}((100x+50)/n)$$

2781 where n is the value of "job-priority-supported" and x ranges from 0 through n-1.

2782 For example, if n=1 the sequence of values is 50; if n=2, the sequence of values is: 25 and 75; if n = 3, the
 2783 sequence of values is: 17, 50 and 83; if n = 10, the sequence of values is: 5, 15, 25, 35, 45, 55, 65, 75, 85,
 2784 and 95; if n = 100, the sequence of values is: 1, 2, 3, ... 100.

2785 If the value of the Printer object's "job-priority-supported" is 10 and the client supplies values in the range 1
 2786 to 10, the Printer object maps them to 5, in the range 11 to 20, the Printer object maps them to 15, etc.

2787 4.2.2 job-hold-until (type3 keyword | name (MAX))

2788 This attribute specifies the named time period during which the Job MUST become a candidate for printing.

2789 Standard keyword values for named time periods are:

2790 'no-hold': immediately, if there are not other reasons to hold the job

2791 'indefinite': - the job is held indefinitely, until a client performs a Release-Job (section 3.3.6)

2792 'day-time': during the day

2793 'evening': evening

2794 'night': night

2795 'weekend': weekend

2796 'second-shift': second-shift (after close of business)

2797 'third-shift': third-shift (after midnight)

2798

2799 An administrator MUST associate allowable print times with a named time period (by means outside the
2800 scope of this IPP/1.1 document). An administrator is encouraged to pick names that suggest the type of
2801 time period. An administrator MAY define additional values using the 'name' or 'keyword' attribute syntax,
2802 depending on implementation.

2803 If the value of this attribute specifies a time period that is in the future, the Printer SHOULD add the 'job-
2804 hold-until-specified' value to the job's "job-state-reasons" attribute, MUST move the job to the 'pending-
2805 held' state, and MUST NOT schedule the job for printing until the specified time-period arrives.

2806 When the specified time period arrives, the Printer MUST remove the 'job-hold-until-specified' value from
2807 the job's "job-state-reason" attribute, if present. If there are no other job state reasons that keep the job in
2808 the 'pending-held' state, the Printer MUST consider the job as a candidate for processing by moving the job
2809 to the 'pending' state. **Issue 30**

2810 If this job attribute value is the named value 'no-hold', or the specified time period has already started, the
2811 job MUST be a candidate for processing immediately.

2812 If the client does not supply this attribute and this attribute is supported by the Printer object, the Printer
2813 object MUST use the value of the Printer object's "job-hold-until-default" at job submission time (unlike
2814 most Job Template attributes that are used if necessary at job processing time).

2815 4.2.3 job-sheets (type3 keyword | name(MAX))

2816 This attribute determines which job start/end sheet(s), if any, MUST be printed with a job.

2817 Standard keyword values are:

2818 'none': no job sheet is printed

2819 'standard': one or more site specific standard job sheets are printed, e.g. a single start sheet or both start
2820 and end sheet is printed

2821

2822 An administrator MAY define additional values using the 'name' or 'keyword' attribute syntax, depending
2823 on implementation.

2824 The effect of this attribute on jobs with multiple documents MAY be affected by the "multiple-document-
2825 handling" job attribute (section 4.2.4), depending on the job sheet semantics.

2826 4.2.4 multiple-document-handling (type2 keyword)

2827 This attribute is relevant only if a job consists of two or more documents. This attribute MUST be
2828 supported if the Printer supports multiple documents per job (see sections 3.2.4 and 3.3.1). **Issue 34** The
2829 attribute controls finishing operations and the placement of one or more print-stream pages into impressions
2830 and onto media sheets. When the value of the "copies" attribute exceeds 1, it also controls the order in
2831 which the copies that result from processing the documents are produced. For the purposes of this
2832 explanation, if "a" represents an instance of document data, then the result of processing the data in
2833 document "a" is a sequence of media sheets represented by "a(*)".

2834 Standard keyword values are:

2835 'single-document': If a Job object has multiple documents, say, the document data is called a and b, then
2836 the result of processing all the document data (a and then b) MUST be treated as a single sequence
2837 of media sheets for finishing operations; that is, finishing would be performed on the concatenation
2838 of the sequences a(*),b(*). The Printer object MUST NOT force the data in each document instance
2839 to be formatted onto a new print-stream page, nor to start a new impression on a new media sheet. If
2840 more than one copy is made, the ordering of the sets of media sheets resulting from processing the
2841 document data MUST be a(*), b(*), a(*), b(*), ..., and the Printer object MUST force each copy
2842 (a(*),b(*)) to start on a new media sheet.

2843 'separate-documents-uncollated-copies': If a Job object has multiple documents, say, the document data
2844 is called a and b, then the result of processing the data in each document instance MUST be treated
2845 as a single sequence of media sheets for finishing operations; that is, the sets a(*) and b(*) would
2846 each be finished separately. The Printer object MUST force each copy of the result of processing the
2847 data in a single document to start on a new media sheet. If more than one copy is made, the ordering
2848 of the sets of media sheets resulting from processing the document data MUST be a(*), a(*), ...,
2849 b(*), b(*)

2850 'separate-documents-collated-copies': If a Job object has multiple documents, say, the document data is
2851 called a and b, then the result of processing the data in each document instance MUST be treated as
2852 a single sequence of media sheets for finishing operations; that is, the sets a(*) and b(*) would each
2853 be finished separately. The Printer object MUST force each copy of the result of processing the data
2854 in a single document to start on a new media sheet. If more than one copy is made, the ordering of
2855 the sets of media sheets resulting from processing the document data MUST be a(*), b(*), a(*), b(*),
2856

2857 'single-document-new-sheet': Same as 'single-document', except that the Printer object MUST ensure
2858 that the first impression of each document instance in the job is placed on a new media sheet. This
2859 value allows multiple documents to be stapled together with a single staple where each document
2860 starts on a new sheet.

2861

2862 The 'single-document' value is the same as 'separate-documents-collated-copies' with respect to ordering of
 2863 print-stream pages, but not media sheet generation, since 'single-document' will put the first page of the
 2864 next document on the back side of a sheet if an odd number of pages have been produced so far for the job,
 2865 while 'separate-documents-collated-copies' always forces the next document or document copy on to a new
 2866 sheet. In addition, if the "finishings" attribute specifies 'staple', then with 'single-document', documents a
 2867 and b are stapled together as a single document with no regard to new sheets, with 'single-document-new-
 2868 sheet', documents a and b are stapled together as a single document, but document b starts on a new sheet,
 2869 but with 'separate-documents-uncollated-copies' and 'separate-documents-collated-copies', documents a and
 2870 b are stapled separately.

2871 Note: None of these values provide means to produce uncollated sheets within a document, i.e., where
 2872 multiple copies of sheet n are produced before sheet n+1 of the same document.

2873 The relationship of this attribute and the other attributes that control document processing is described in
 2874 section 15.3.

2875 4.2.5 copies (integer(1:MAX))

2876 This attribute specifies the number of copies to be printed.

2877 On many devices the supported number of collated copies will be limited by the number of physical output
 2878 bins on the device, and may be different from the number of uncollated copies which can be supported.

2879 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
 2880 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
 2881 control document processing is described in section 15.3.

2882 4.2.6 finishings (1setOf type2 enum)

2883 This attribute identifies the finishing operations that the Printer uses for each copy of each printed
 2884 document in the Job. For Jobs with multiple documents, the "multiple-document-handling" attribute
 2885 determines what constitutes a "copy" for purposes of finishing.

2886 Standard enum values are:

2887	Value	Symbolic Name and Description
2888		
2889	'3'	'none': Perform no finishing
2890	'4'	'staple': Bind the document(s) with one or more staples. The exact number and placement of
2891		the staples is site-defined.
2892	'5'	'punch': This value indicates that holes are required in the finished document. The exact
2893		number and placement of the holes is site-defined The punch specification MAY be
2894		satisfied (in a site- and implementation-specific manner) either by drilling/punching,
2895		or by substituting pre-drilled media.

- 2896 '6' 'cover': This value is specified when it is desired to select a non-printed (or pre-printed)
2897 cover for the document. This does not supplant the specification of a printed cover
2898 (on cover stock medium) by the document itself.
- 2899 '7' 'bind': This value indicates that a binding is to be applied to the document; the type and
2900 placement of the binding is site-defined.
2901
- 2902 '8' 'saddle-stitch': Bind the document(s) with one or more staples (wire stitches) along the
2903 middle fold. The exact number and placement of the staples and the middle fold is
2904 implementation and/or site-defined.
- 2905 '9' 'edge-stitch': Bind the document(s) with one or more staples (wire stitches) along one edge.
2906 The exact number and placement of the staples is implementation and/or site-
2907 defined.
2908 '10'-'19' reserved for future generic finishing enum values.

2909 The following values are more specific; they indicate a corner or an edge as if the document were a portrait
2910 document (see below):

- 2911 '20' 'staple-top-left': Bind the document(s) with one or more staples in the top left corner.
- 2912 '21' 'staple-bottom-left': Bind the document(s) with one or more staples in the bottom left
2913 corner.
- 2914 '22' 'staple-top-right': Bind the document(s) with one or more staples in the top right corner.
- 2915 '23' 'staple-bottom-right': Bind the document(s) with one or more staples in the bottom right
2916 corner.
- 2917 '24' 'edge-stitch-left': Bind the document(s) with one or more staples (wire stitches) along the
2918 left edge. The exact number and placement of the staples is implementation and/or
2919 site-defined.
- 2920 '25' 'edge-stitch-top': Bind the document(s) with one or more staples (wire stitches) along the
2921 top edge. The exact number and placement of the staples is implementation and/or
2922 site-defined.
- 2923 '26' 'edge-stitch-right': Bind the document(s) with one or more staples (wire stitches) along the
2924 right edge. The exact number and placement of the staples is implementation and/or
2925 site-defined.
- 2926 '27' 'edge-stitch-bottom': Bind the document(s) with one or more staples (wire stitches) along
2927 the bottom edge. The exact number and placement of the staples is implementation
2928 and/or site-defined.
- 2929 '28' 'staple-dual-left': Bind the document(s) with two staples (wire stitches) along the left edge
2930 assuming a portrait document (see above).
- 2931 '29' 'staple-dual-top': Bind the document(s) with two staples (wire stitches) along the top edge
2932 assuming a portrait document (see above).
- 2933 '30' 'staple-dual-right': Bind the document(s) with two staples (wire stitches) along the right
2934 edge assuming a portrait document (see above).
- 2935 '31' 'staple-dual-bottom': Bind the document(s) with two staples (wire stitches) along the bottom
2936 edge assuming a portrait document (see above).

2937 The 'staple-xxx' values are specified with respect to the document as if the document were a portrait
2938 document. If the document is actually a landscape or a reverse-landscape document, the client supplies the
2939 appropriate transformed value. For example, to position a staple in the upper left hand corner of a

2940 landscape document when held for reading, the client supplies the 'staple-bottom-left' value (since
2941 landscape is defined as a +90 degree rotation from portrait, i.e., anti-clockwise). On the other hand, to
2942 position a staple in the upper left hand corner of a reverse-landscape document when held for reading, the
2943 client supplies the 'staple-top-right' value (since reverse-landscape is defined as a -90 degree rotation from
2944 portrait, i.e., clockwise).

2945 The angle (vertical, horizontal, angled) of each staple with respect to the document depends on the
2946 implementation which may in turn depend on the value of the attribute.

2947 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
2948 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
2949 control document processing is described in section 15.3.

2950 If the client supplies a value of 'none' along with any other combination of values, it is the same as if only
2951 that other combination of values had been supplied (that is the 'none' value has no effect).

2952 4.2.7 page-ranges (1setOf rangeOfInteger (1:MAX))

2953 This attribute identifies the range(s) of print-stream pages that the Printer object uses for each copy of each
2954 document which are to be printed. Nothing is printed for any pages identified that do not exist in the
2955 document(s). Ranges MUST be in ascending order, for example: 1-3, 5-7, 15-19 and MUST NOT overlap,
2956 so that a non-spooling Printer object can process the job in a single pass. If the ranges are not ascending or
2957 are overlapping, the IPP object MUST reject the request and return the 'client-error-bad-request' status code.
2958 The attribute is associated with print-stream pages not application-numbered pages (for example, the page
2959 numbers found in the headers and or footers for certain word processing applications).

2960 For Jobs with multiple documents, the "multiple-document-handling" attribute determines what constitutes
2961 a "copy" for purposes of the specified page range(s). When "multiple-document-handling" is 'single-
2962 document', the Printer object MUST apply each supplied page range once to the concatenation of the print-
2963 stream pages. For example, if there are 8 documents of 10 pages each, the page-range '41:60' prints the
2964 pages in the 5th and 6th documents as a single document and none of the pages of the other documents are
2965 printed. When "multiple-document-handling" is 'separate-documents-uncollated-copies' or 'separate-
2966 documents-collated-copies', the Printer object MUST apply each supplied page range repeatedly to each
2967 document copy. For the same job, the page-range '1:3, 10:10' would print the first 3 pages and the 10th
2968 page of each of the 8 documents in the Job, as 8 separate documents.

2969 In most cases, the exact pages to be printed will be generated by a device driver and this attribute would not
2970 be required. However, when printing an archived document which has already been formatted, the end user
2971 may elect to print just a subset of the pages contained in the document. In this case, if page-range = n.m is
2972 specified, the first page to be printed will be page n. All subsequent pages of the document will be printed
2973 through and including page m.

2974 "page-ranges-supported" is a boolean value indicating whether or not the printer is capable of supporting
2975 the printing of page ranges. This capability may differ from one PDL to another. There is no "page-ranges-
2976 default" attribute. If the "page-ranges" attribute is not supplied by the client, all pages of the document will
2977 be printed.

2978 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
 2979 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
 2980 control document processing is described in section 15.3.

2981 4.2.8 sides (type2 keyword)

2982 This attribute specifies how print-stream pages are to be imposed upon the sides of an instance of a selected
 2983 medium, i.e., an impression.

2984 The standard keyword values are:

2985 'one-sided': imposes each consecutive print-stream page upon the same side of consecutive media
 2986 sheets.

2987 'two-sided-long-edge': imposes each consecutive pair of print-stream pages upon front and back sides of
 2988 consecutive media sheets, such that the orientation of each pair of print-stream pages on the medium
 2989 would be correct for the reader as if for binding on the long edge. This imposition is sometimes
 2990 called 'duplex' or 'head-to-head'.

2991 'two-sided-short-edge': imposes each consecutive pair of print-stream pages upon front and back sides
 2992 of consecutive media sheets, such that the orientation of each pair of print-stream pages on the
 2993 medium would be correct for the reader as if for binding on the short edge. This imposition is
 2994 sometimes called 'tumble' or 'head-to-toe'.

2995

2996 'two-sided-long-edge', 'two-sided-short-edge', 'tumble', and 'duplex' all work the same for portrait or
 2997 landscape. However 'head-to-toe' is 'tumble' in portrait but 'duplex' in landscape. 'head-to-head' also
 2998 switches between 'duplex' and 'tumble' when using portrait and landscape modes.

2999 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
 3000 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
 3001 control document processing is described in section 15.3.

3002 4.2.9 number-up (integer(1:MAX))

3003 This attribute specifies the number of print-stream pages to impose upon a single side of an instance of a
 3004 selected medium. For example, if the value is:

3005 Value	Description
3006 '1'	the Printer MUST place one print-stream page on a single side of an instance of the selected
3007	medium (MAY add some sort of translation, scaling, or rotation).
3008 '2'	the Printer MUST place two print-stream pages on a single side of an instance of the selected
3009	medium (MAY add some sort of translation, scaling, or rotation).
3010 '4'	the Printer MUST place four print-stream pages on a single side of an instance of the
3011	selected medium (MAY add some sort of translation, scaling, or rotation).
3012	
3013	

3013

3014 This attribute primarily controls the translation, scaling and rotation of print-stream pages.

3015 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
3016 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
3017 control document processing is described in section 15.3.

3018 4.2.10 orientation-requested (type2 enum)

3019 This attribute indicates the desired orientation for printed print-stream pages; it does not describe the
3020 orientation of the client-supplied print-stream pages.

3021 For some document formats (such as 'application/postscript'), the desired orientation of the print-stream
3022 pages is specified within the document data. This information is generated by a device driver prior to the
3023 submission of the print job. Other document formats (such as 'text/plain') do not include the notion of
3024 desired orientation within the document data. In the latter case it is possible for the Printer object to bind
3025 the desired orientation to the document data after it has been submitted. It is expected that a Printer object
3026 would only support "orientations-requested" for some document formats (e.g., 'text/plain' or 'text/html') but
3027 not others (e.g., 'application/postscript'). This is no different than any other Job Template attribute since
3028 section 4.2, item 1, points out that a Printer object may support or not support any Job Template attribute
3029 based on the document format supplied by the client. However, a special mention is made here since it is
3030 very likely that a Printer object will support "orientation-requested" for only a subset of the supported
3031 document formats.

3032 Standard enum values are:

3033	Value	Symbolic Name and Description
3034		
3035	'3'	'portrait': The content will be imaged across the short edge of the medium.
3036	'4'	'landscape': The content will be imaged across the long edge of the medium. Landscape is
3037		defined to be a rotation of the print-stream page to be imaged by +90 degrees with
3038		respect to the medium (i.e. anti-clockwise) from the portrait orientation. Note: The
3039		+90 direction was chosen because simple finishing on the long edge is the same edge
3040		whether portrait or landscape
3041	'5'	'reverse-landscape': The content will be imaged across the long edge of the medium.
3042		Reverse-landscape is defined to be a rotation of the print-stream page to be imaged
3043		by -90 degrees with respect to the medium (i.e. clockwise) from the portrait
3044		orientation. Note: The 'reverse-landscape' value was added because some
3045		applications rotate landscape -90 degrees from portrait, rather than +90 degrees.
3046	'6'	'reverse-portrait': The content will be imaged across the short edge of the medium. Reverse-
3047		portrait is defined to be a rotation of the print-stream page to be imaged by 180
3048		degrees with respect to the medium from the portrait orientation. Note: The 'reverse-
3049		portrait' value was added for use with the "finishings" attribute in cases where the
3050		opposite edge is desired for finishing a portrait document on simple finishing devices
3051		that have only one finishing position. Thus a 'text/plain' portrait document can be
3052		stapled "on the right" by a simple finishing device as is common use with some
3053		middle eastern languages such as Hebrew.
3054		

3055 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
3056 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
3057 control document processing is described in section 15.3.

3058 4.2.11 media (type3 keyword | name(MAX))

3059 This attribute identifies the medium that the Printer uses for all impressions of the Job.

3060 The values for "media" include medium-names, medium-sizes, input-trays and electronic forms so that one
3061 attribute specifies the media. If a Printer object supports a medium name as a value of this attribute, such a
3062 medium name implicitly selects an input-tray that contains the specified medium. If a Printer object
3063 supports a medium size as a value of this attribute, such a medium size implicitly selects a medium name
3064 that in turn implicitly selects an input-tray that contains the medium with the specified size. If a Printer
3065 object supports an input-tray as the value of this attribute, such an input-tray implicitly selects the medium
3066 that is in that input-tray at the time the job prints. This case includes manual-feed input-trays. If a Printer
3067 object supports an electronic form as the value of this attribute, such an electronic form implicitly selects a
3068 medium-name that in turn implicitly selects an input-tray that contains the medium specified by the
3069 electronic form. The electronic form also implicitly selects an image that the Printer MUST merge with the
3070 document data as its prints each page.

3071 Standard keyword values are (taken from ISO DPA and the Printer MIB) and are listed in section 14. An
3072 administrator MAY define additional values using the 'name' or 'keyword' attribute syntax, depending on
3073 implementation.

3074 There is also an additional Printer attribute named "media-ready" which differs from "media-supported" in
3075 that legal values only include the subset of "media-supported" values that are physically loaded and ready
3076 for printing with no operator intervention required. If an IPP object supports "media-supported", it NEED
3077 NOT support "media-ready".

3078 The relationship of this attribute and the other attributes that control document processing is described in
3079 section 15.3.

3080 4.2.12 printer-resolution (resolution)

3081 This attribute identifies the resolution that Printer uses for the Job.

3082 4.2.13 print-quality (type2 enum)

3083 This attribute specifies the print quality that the Printer uses for the Job.

3084 The standard enum values are:

3085	Value	Symbolic Name and Description
3086		
3087	'3'	'draft': lowest quality available on the printer
3088	'4'	'normal': normal or intermediate quality on the printer

3089 '5' 'high': highest quality available on the printer
3090

3091 4.3 Job Description Attributes

3092 The attributes in this section form the attribute group called "job-description". The following table
3093 summarizes these attributes. The third column indicates whether the attribute is a REQUIRED attribute
3094 that MUST be supported by Printer objects. If it is not indicated as REQUIRED, then it is OPTIONAL.
3095 The maximum size in octets for 'text' and 'name' attributes is indicated in parentheses.

3096	+	-----+	+	-----+	+	-----+
3097		Attribute		Syntax		REQUIRED?
3098	+	-----+	+	-----+	+	-----+
3099		job-uri		uri		REQUIRED
3100	+	-----+	+	-----+	+	-----+
3101		job-id		integer(1:MAX)		REQUIRED
3102	+	-----+	+	-----+	+	-----+
3103		job-printer-uri		uri		REQUIRED
3104	+	-----+	+	-----+	+	-----+
3105		job-more-info		uri

3157 4.3.1 job-uri (uri)

3158 This REQUIRED attribute contains the URI for the job. The Printer object, on receipt of a new job,
 3159 generates a URI which identifies the new Job. The Printer object returns the value of the "job-uri" attribute
 3160 as part of the response to a create request. The precise format of a Job URI is implementation dependent.
 3161 If the Printer object supports more than one URI and there is some relationship between the newly formed
 3162 Job URI and the Printer object's URI, the Printer object uses the Printer URI supplied by the client in the
 3163 create request. For example, if the create request comes in over a secure channel, the new Job URI MUST
 3164 use the same secure channel. This can be guaranteed because the Printer object is responsible for
 3165 generating the Job URI and the Printer object is aware of its security configuration and policy as well as the
 3166 Printer URI used in the create request.

3167 For a description of this attribute and its relationship to "job-id" and "job-printer-uri" attribute, see the
 3168 discussion in section 2.4 on "Object Identity".

3169 4.3.2 job-id (integer(1:MAX))

3170 This REQUIRED attribute contains the ID of the job. The Printer, on receipt of a new job, generates an ID
 3171 which identifies the new Job on that Printer. The Printer returns the value of the "job-id" attribute as part of
 3172 the response to a create request. The 0 value is not included to allow for compatibility with SNMP index
 3173 values which also cannot be 0.

3174 For a description of this attribute and its relationship to "job-uri" and "job-printer-uri" attribute, see the
 3175 discussion in section 2.4 on "Object Identity".

3176 4.3.3 job-printer-uri (uri)

3177 This REQUIRED attribute identifies the Printer object that created this Job object. When a Printer object
 3178 creates a Job object, it populates this attribute with the Printer object URI that was used in the create
 3179 request. This attribute permits a client to identify the Printer object that created this Job object when only
 3180 the Job object's URI is available to the client. The client queries the creating Printer object to determine
 3181 which languages, charsets, operations, are supported for this Job.

3182 For a description of this attribute and its relationship to "job-uri" and "job-id" attribute, see the discussion in
 3183 section 2.4 on "Object Identity".

3184 4.3.4 job-more-info (uri)

3185 Similar to "printer-more-info", this attribute contains the URI referencing some resource with more
3186 information about this Job object, perhaps an HTML page containing information about the Job.

3187 4.3.5 job-name (name(MAX))

3188 This REQUIRED attribute is the name of the job. It is a name that is more user friendly than the "job-uri"
3189 attribute value. It does not need to be unique between Jobs. The Job's "job-name" attribute is set to the
3190 value supplied by the client in the "job-name" operation attribute in the create request (see Section 3.2.1.1).
3191 If, however, the "job-name" operation attribute is not supplied by the client in the create request, the Printer
3192 object, on creation of the Job, MUST generate a name. The printer SHOULD generate the value of the
3193 Job's "job-name" attribute from the first of the following sources that produces a value: 1) the "document-
3194 name" operation attribute of the first (or only) document, 2) the "document-URI" attribute of the first (or
3195 only) document, or 3) any other piece of Job specific and/or Document Content information.

3196 4.3.6 job-originating-user-name (name(MAX))

3197 This REQUIRED attribute contains the name of the end user that submitted the print job. The Printer
3198 object sets this attribute to the most authenticated printable name that it can obtain from the authentication
3199 service over which the IPP operation was received. Only if such is not available, does the Printer object use
3200 the value supplied by the client in the "requesting-user-name" operation attribute of the create operation
3201 (see Section 8).

3202 Note: The Printer object needs to keep an internal originating user id of some form, typically as a credential
3203 of a principal, with the Job object. Since such an internal attribute is implementation-dependent and not of
3204 interest to clients, it is not specified as a Job Description attribute. This originating user id is used for
3205 authorization checks (if any) on all subsequent operation.

3206 4.3.7 job-state (type1 enum)

3207 This REQUIRED attribute identifies the current state of the job. Even though the IPP protocol defines
3208 seven values for job states (plus the out-of-band 'unknown' value - see Section 4.1), implementations only
3209 need to support those states which are appropriate for the particular implementation. In other words, a
3210 Printer supports only those job states implemented by the output device and available to the Printer object
3211 implementation.

3212 Standard enum values are:

3213 Values Symbolic Name and Description

3214
3215 '3' 'pending': The job is a candidate to start processing, but is not yet processing.

3216
3217 '4' 'pending-held': The job is not a candidate for processing for any number of reasons but will
3218 return to the 'pending' state as soon as the reasons are no longer present. The job's

3219 "job-state-reason" attribute MUST indicate why the job is no longer a candidate for
3220 processing.

3221
3222 '5' 'processing': One or more of:

- 3223
3224 1. the job is using, or is attempting to use, one or more purely software processes
3225 that are analyzing, creating, or interpreting a PDL, etc.,
3226 2. the job is using, or is attempting to use, one or more hardware devices that are
3227 interpreting a PDL, making marks on a medium, and/or performing finishing, such as
3228 stapling, etc.,
3229 3. the Printer object has made the job ready for printing, but the output device is not
3230 yet printing it, either because the job hasn't reached the output device or because the
3231 job is queued in the output device or some other spooler, awaiting the output device
3232 to print it.
3233

3234 When the job is in the 'processing' state, the entire job state includes the detailed
3235 status represented in the Printer object's "printer-state", "printer-state-reasons", and
3236 "printer-state-message" attributes.

3237 Implementations MAY, though they NEED NOT, include additional values in the
3238 job's "job-state-reasons" attribute to indicate the progress of the job, such as adding
3239 the 'job-printing' value to indicate when the output device is actually making marks
3240 on paper and/or the 'processing-to-stop-point' value to indicate that the IPP object is
3241 in the process of canceling or aborting the job. Most implementations won't bother
3242 with this nuance.
3243

3244 '6' 'processing-stopped': The job has stopped while processing for any number of reasons and
3245 will return to the 'processing' state as soon as the reasons are no longer present.
3246

3247 The job's "job-state-reason" attribute MAY indicate why the job has stopped
3248 processing. For example, if the output device is stopped, the 'printer-stopped' value
3249 MAY be included in the job's "job-state-reasons" attribute.
3250

3251 Note: When an output device is stopped, the device usually indicates its condition in
3252 human readable form locally at the device. A client can obtain more complete device
3253 status remotely by querying the Printer object's "printer-state", "printer-state-reasons"
3254 and "printer-state-message" attributes.
3255

3256 '7' 'canceled': The job has been canceled by a Cancel-Job operation and the Printer object has
3257 completed canceling the job and all job status attributes have reached their final
3258 values for the job. While the Printer object is canceling the job, the job remains in its
3259 current state, but the job's "job-state-reasons" attribute SHOULD contain the
3260 'processing-to-stop-point' value and one of the 'canceled-by-user', 'canceled-by-
3261 operator', or 'canceled-at-device' value. When the job moves to the 'canceled' state,

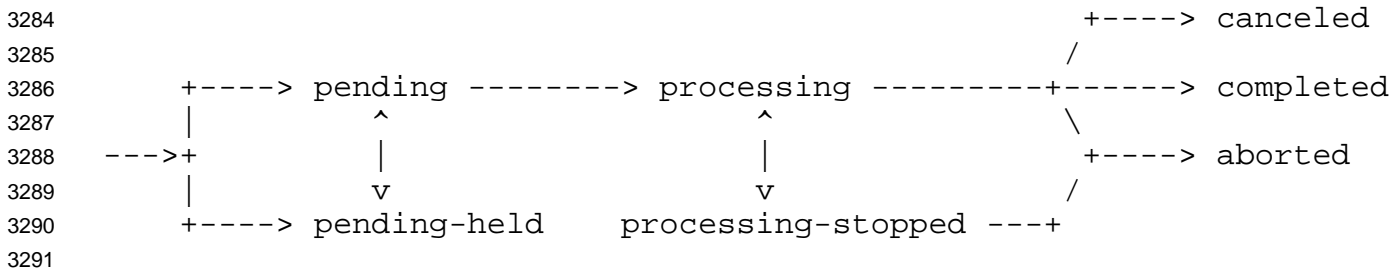

3262 the 'processing-to-stop-point' value, if present, MUST be removed, but the 'canceled-
3263 by-xxx', if present, MUST remain.

3264
3265 '8' 'aborted': The job has been aborted by the system, usually while the job was in the
3266 'processing' or 'processing-stopped' state and the Printer has completed aborting the
3267 job and all job status attributes have reached their final values for the job. While the
3268 Printer object is aborting the job, the job remains in its current state, but the job's
3269 "job-state-reasons" attribute SHOULD contain the 'processing-to-stop-point' and
3270 'aborted-by-system' values. When the job moves to the 'aborted' state, the
3271 'processing-to-stop-point' value, if present, MUST be removed, but the 'aborted-by-
3272 system' value, if present, MUST remain.

3273
3274 '9' 'completed': The job has completed successfully or with warnings or errors after processing
3275 and all of the job media sheets have been successfully stacked in the appropriate
3276 output bin(s) and all job status attributes have reached their final values for the job.
3277 The job's "job-state-reasons" attribute SHOULD contain one of: 'completed-
3278 successfully', 'completed-with-warnings', or 'completed-with-errors' values.

3280 The final value for this attribute MUST be one of: 'completed', 'canceled', or 'aborted' before the Printer
3281 removes the job altogether. The length of time that jobs remain in the 'canceled', 'aborted', and 'completed'
3282 states depends on implementation. See section 4.3.7.2.

3283 The following figure shows the normal job state transitions.

3292 Normally a job progresses from left to right. Other state transitions are unlikely, but are not forbidden. Not
3293 shown are the transitions to the 'canceled' state from the 'pending', 'pending-held', and 'processing-stopped'
3294 states.

3295 Jobs reach one of the three terminal states: 'completed', 'canceled', or 'aborted', after the jobs have
3296 completed all activity, including stacking output media, after the jobs have completed all activity, and all
3297 job status attributes have reached their final values for the job.

3298 4.3.7.1 Forwarding Servers **Issue 14**

3299 As with all other IPP attributes, if the implementation cannot determine the correct value for this attribute,
3300 it SHOULD respond with the out-of-band value 'unknown' (see section 4.1) rather than try to guess at some
3301 possibly incorrect value and give the end user the wrong impression about the state of the Job object. For
3302 example, if the implementation is just a gateway into some printing system from which it can normally get

3303 status, but temporarily is unable, then the implementation should return the 'unknown' value. However, if
3304 the implementation is a gateway to a printing system that never provides detailed status about the print job,
3305 the implementation MAY set the IPP Job object's state to 'completed', provided that it also sets the 'queued-
3306 in-device' value in the job's "job-state-reasons" attribute (see section 4.3.8). **Issue 14**

3307 4.3.7.2 Partitioning of Job States

3308 This section partitions the 7 job states into phases: Job Not Completed, Job Retention, Job History, and Job
3309 Removal. This section also explains the 'job-restartable' value of the "job-state-reasons" Job Description
3310 attribute for use with the Restart-Job operation.

3311 Job Not Completed: When a job is in the 'pending', 'pending-held', 'processing', or 'processing-stopped'
3312 states, the job is not completed.

3313 Job Retention: When a job enters one of the three terminal job states: 'completed', 'canceled', or 'aborted',
3314 the IPP Printer object MAY "retain" the job in a restartable condition for an implementation-defined time
3315 period. This time period MAY be zero seconds and MAY depend on the terminal job state. This phase is
3316 called Job Retention. While in the Job Retention phase, the job's document data is retained and a client
3317 may restart the job using the Restart-Job operation. If the IPP object supports **Issue 30** the Restart-Job
3318 operation, then it SHOULD indicate that the job is restartable by adding the 'job-restartable' value to the
3319 job's "job-state-reasons" attribute (see Section 4.3.8) during the Job Retention phase.

3320 Job History: After the Job Retention phase expires for a job, the Printer object deletes the document data
3321 for the job and the job becomes part of the Job History. The Printer object MAY also delete any number of
3322 the job attributes. Since the job is no longer restartable, the Printer object MUST remove the 'job-
3323 restartable' value from the job's "job-state-reasons" attribute, if present.

3324 Job Removal: After the job has remained in the Job History for an implementation-defined time, such as
3325 when the number of jobs exceeds a fixed number or after a fixed time period (which MAY be zero
3326 seconds), the IPP Printer removes the job from the system.

3327 Using the Get-Jobs operation and supplying the 'not-completed' value for the "which-jobs" operation
3328 attribute, a client is requesting jobs in the Job Not Completed phase. Using the Get-Jobs operation and
3329 supplying the 'completed' value for the "which-jobs" operation attribute, a client is requesting jobs in the
3330 Job Retention and Job History phases. Using the Get-Job-Attributes operation, a client is requesting a job
3331 in any phase except Job Removal. After Job Removal, the Get-Job-Attributes and Get-Jobs operations no
3332 longer are capable of returning any information about a job.

3333 4.3.8 job-state-reasons (1setOf type2 keyword)

3334 This REQUIRED attribute provides additional information about the job's current state, i.e., information
3335 that augments the value of the job's "job-state" attribute.

3336 These values MAY be used with any job state or states for which the reason makes sense. Some of these
3337 value definitions indicate conformance requirements; the rest are OPTIONAL. **Issue 30** Furthermore,
3338 when implemented, the Printer MUST return these values when the reason applies and MUST NOT return
3339 them when the reason no longer applies whether the value of the Job's "job-state" attribute changed or not.

3340 When the Job does not have any reasons for being in its current state, the value of the Job's "job-state-
3341 reasons" attribute MUST be 'none'.

3342 Note: While values cannot be added to the 'job-state' attribute without impacting deployed clients that take
3343 actions upon receiving "job-state" values, it is the intent that additional "job-state-reasons" values can be
3344 defined and registered without impacting such deployed clients. In other words, the "job-state-reasons"
3345 attribute is intended to be extensible.

3346 The following standard keyword values are defined. For ease of understanding, the values are presented in
3347 the order in which the reasons are likely to occur (if implemented), starting with the 'job-incoming' value:

- 3348 'none': There are no reasons for the job's current state. This state reason is semantically equivalent to
3349 "job-state-reasons" without any value and MUST be used when there is no other value, since the
3350 lsetOf attribute syntax requires at least one value. **Issue 30**
- 3351 'job-incoming': The Create-Job operation has been accepted by the Printer, but the Printer is expecting
3352 additional Send-Document and/or Send-URI operations and/or is accessing/accepting document
3353 data.
- 3354 'job-data-insufficient': The Create-Job operation has been accepted by the Printer, but the Printer is
3355 expecting additional document data before it can move the job into the 'processing' state. If a Printer
3356 starts processing before it has received all data, the Printer removes the 'job-data-insufficient'
3357 reason, but the 'job-incoming' remains. If a Printer starts processing after it has received all data, the
3358 Printer removes the 'job-data-insufficient' reason and the 'job-incoming' at the same time. **Issue 13**
- 3359 'document-access-error': After accepting a Print-URI or Send-URI request, the Printer could not access
3360 one or more documents passed by reference. This reason is intended to cover any file access
3361 problem, including file does not exist and access denied because of an access control problem. The
3362 Printer MAY also indicate the document access error using the "job-document-access-errors" Job
3363 Description attribute (see section 4.3.11). Whether the Printer aborts the job and moves the job to
3364 the 'aborted' job state or prints all documents that are accessible and moves the job to the 'completed'
3365 job state and adds the 'completed-with-errors' value in the job's "job-state-reasons" attribute depends
3366 on implementation and/or site policy. This value SHOULD be supported if the Print-URI or Send-
3367 URI operations are supported. **Issue 30 and Issue 35**
- 3368 'submission-interrupted': The job was not completely submitted for some unforeseen reason, such as:
3369 (1) the Printer has crashed before the job was closed by the client, (2) the Printer or the document
3370 transfer method has crashed in some non-recoverable way before the document data was entirely
3371 transferred to the Printer, (3) the client crashed or failed to close the job before the time-out period.
3372 See section 4.4.31.
- 3373 'job-outgoing': The Printer is transmitting the job to the output device.
- 3374 'job-hold-until-specified': The value of the job's "job-hold-until" attribute was specified with a time
3375 period that is still in the future. The job MUST NOT be a candidate for processing until this reason
3376 is removed and there are no other reasons to hold the job. This value SHOULD be supported if the
3377 "job-hold-until" Job Template attribute is supported. **Issue 30**
- 3378 'resources-are-not-ready': At least one of the resources needed by the job, such as media, fonts, resource
3379 objects, etc., is not ready on any of the physical printer's for which the job is a candidate. This
3380 condition MAY be detected when the job is accepted, or subsequently while the job is pending or
3381 processing, depending on implementation. The job may remain in its current state or be moved to
3382 the 'pending-held' state, depending on implementation and/or job scheduling policy.

- 3383 'printer-stopped-partly': The value of the Printer's "printer-state-reasons" attribute contains the value
3384 'stopped-partly'.
- 3385 'printer-stopped': The value of the Printer's "printer-state" attribute is 'stopped'.
- 3386 'job-interpreting': Job is in the 'processing' state, but more specifically, the Printer is interpreting the
3387 document data.
- 3388 'job-queued': Job is in the 'processing' state, but more specifically, the Printer has queued the document
3389 data.
- 3390 'job-transforming': Job is in the 'processing' state, but more specifically, the Printer is interpreting
3391 document data and producing another electronic representation.
- 3392 'job-queued-for-marker': Job is in any of the 'pending-held', 'pending', or 'processing' states, but more
3393 specifically, the Printer has completed enough processing of the document to be able to start
3394 marking and the job is waiting for the marker. Systems that require human intervention to release
3395 jobs using the Release-Job operation, put the job into the 'pending-held' job state. Systems that
3396 automatically select a job to use the marker put the job into the 'pending' job state or keep the job in
3397 the 'processing' job state while waiting for the marker, depending on implementation. All
3398 implementations put the job into (or back into) the 'processing' state when marking does begin.
3399 **Issue 31**
- 3400 'job-printing': The output device is marking media. This value is useful for Printers which spend a great
3401 deal of time processing (1) when no marking is happening and then want to show that marking is
3402 now happening or (2) when the job is in the process of being canceled or aborted while the job
3403 remains in the 'processing' state, but the marking has not yet stopped so that impression or sheet
3404 counts are still increasing for the job.
- 3405 'job-canceled-by-user': The job was canceled by the owner of the job using the Cancel-Job request, i.e.,
3406 by a user whose authenticated identity is the same as the value of the originating user that created
3407 the Job object, or by some other authorized end-user, such as a member of the job owner's security
3408 group. This value SHOULD be supported. **Issue 30**
- 3409 'job-canceled-by-operator': The job was canceled by the operator using the Cancel-Job request, i.e., by a
3410 user who has been authenticated as having operator privileges (whether local or remote). If the
3411 security policy is to allow anyone to cancel anyone's job, then this value may be used when the job
3412 is canceled by other than the owner of the job. For such a security policy, in effect, everyone is an
3413 operator as far as canceling jobs with IPP is concerned. This value SHOULD be supported if the
3414 implementation permits canceling by other than the owner of the job. **Issue 30**
- 3415 'job-canceled-at-device': The job was canceled by an unidentified local user, i.e., a user at a console at
3416 the device. This value SHOULD be supported if the implementation supports canceling jobs at the
3417 console. **Issue 30**
- 3418 'aborted-by-system': The job (1) is in the process of being aborted, (2) has been aborted by the system
3419 and placed in the 'aborted' state, or (3) has been aborted by the system and placed in the 'pending-
3420 held' state, so that a user or operator can manually try the job again. This value SHOULD be
3421 supported. **Issue 30**
- 3422 'unsupported-compression': The job was aborted by the system because the Printer determined while
3423 attempting to decompress the document-data's that the compression is actually not among those
3424 supported by the Printer. This value MUST be supported, since "compressions is a REQUIRED
3425 operation attribute. **Issue 6**
- 3426 'compression-error': The job was aborted by the system because the Printer encountered an error in the
3427 document-data while decompressing it. If the Printer posts this reason, the document-data has

3428 already passed any tests that would have led to the 'unsupported-compression' job-state-reason. **Issue**
3429 **6**

3430 'unsupported-document-format': The job was aborted by the system because the document-data's
3431 document-format is not among those supported by the Printer. If the client specifies the document-
3432 format as 'application/octet-stream', the printer MAY abort the job and post this reason even though
3433 the format is a member of the "document-format-supported" printer attribute, but not among the
3434 auto-sensed document-formats. This value MUST be supported, since "document-format" is a
3435 REQUIRED operation attribute. **Issue 3**

3436 'document-format-error': The job was aborted by the system because the Printer encountered an error in
3437 the document-data while processing it. If the Printer posts this reason, the document-data has
3438 already passed any tests that would have led to the 'unsupported-document-format' job-state-reason.
3439 **Issue 3**

3440 'processing-to-stop-point': The requester has issued a Cancel-Job operation or the Printer object has
3441 aborted the job, but is still performing some actions on the job until a specified stop point occurs or
3442 job termination/cleanup is completed.

3443 If the implementation requires some measurable time to cancel the job in the 'processing' or
3444 'processing-stopped' job states, the IPP object MUST use this value **Issue 30** to indicate that the
3445 Printer object is still performing some actions on the job while the job remains in the 'processing' or
3446 'processing-stopped' state. After all the job's job description attributes have stopped incrementing,
3447 the Printer object moves the job from the 'processing' state to the 'canceled' or 'aborted' job states.

3448 'service-off-line': The Printer is off-line and accepting no jobs. All 'pending' jobs are put into the
3449 'pending-held' state. This situation could be true if the service's or document transform's input is
3450 impaired or broken.

3451 'job-completed-successfully': The job completed successfully. This value SHOULD be supported.
3452 **Issue 30**

3453 'job-completed-with-warnings': The job completed with warnings. This value SHOULD be supported
3454 if the implementation detects warnings. **Issue 30**

3455 'job-completed-with-errors': The job completed with errors (and possibly warnings too). This value
3456 SHOULD be supported if the implementation detects errors. **Issue 30**

3457 'job-restartable' - This job is retained (see section 4.3.7.2) and is currently able to be restarted using the
3458 Restart-Job operation (see section 3.3.7). If 'job-restartable' is a value of the job's 'job-state-reasons'
3459 attribute, then the IPP object MUST accept a Restart-Job operation for that job. This value
3460 SHOULD be supported if the Restart-Job operation is supported. **Issue 30**

3461 'queued-in-device': The job has been forwarded to a device or print system that is unable to send back
3462 status. The Printer sets the job's "job-state" attribute to 'completed' and adds the 'queued-in-device'
3463 value to the job's "job-state-reasons" attribute to indicate that the Printer has no additional
3464 information about the job and never will have any better information. See section 4.3.7.1. **Issue 14**

3465 4.3.9 job-state-message (text(MAX))

3466 This attribute specifies information about the "job-state" and "job-state-reasons" attributes in human
3467 readable text. If the Printer object supports this attribute, the Printer object MUST be able to generate this
3468 message in any of the natural languages identified by the Printer's "generated-natural-language-supported"
3469 attribute (see the "attributes-natural-language" operation attribute specified in Section 3.1.4.1).

3470 The value SHOULD NOT contain additional information not contained in the values of the "job-state" and
3471 "job-states-reasons" attributes, such as interpreter error information. Otherwise, application programs
3472 might attempt to parse the (localized text). For such additional information such as interpreter errors for
3473 application program consumption or specific document access errors, new attributes with keyword values,
3474 needs to be developed and registered.

3475 4.3.10 job-detailed-status-messages (1setOf text(MAX)) **Issue 35**

3476 This attribute specifies additional detailed and technical information about the job. Neither the Printer nor
3477 the client localizes the message(s), since they are intended for use by the system administrator or other
3478 experienced technical persons. Clients MUST NOT attempt to parse the value of this attribute. See "job-
3479 document-access-errors" (section 4.3.11) for additional errors that a program can process.

3480 4.3.11 job-document-access-errors (1setOf text(MAX)) **Issue 35**

3481 This attribute provides additional information about each document access error for this job encountered by
3482 the Printer after it returned a response to the Print-URI or Send-URI operation and subsequently attempted
3483 to access document(s) supplied in the Print-URI or Send-URI operation. For errors in the protocol that is
3484 identified by the URI scheme in the "document-uri" operation attribute, such as 'http:' or 'ftp:', the error code
3485 is returned in parentheses, followed by the URI. For example:

3486 (404) http://ftp.pwg.org/pub/pwg/ipp/new_MOD/ipp-model-v11-990510.pdf
3487

3488 Most Internet protocols use decimal error codes (unlike IPP), so the ASCII error code representation is in
3489 decimal.

3490 4.3.12 number-of-documents (integer(0:MAX))

3491 This attribute indicates the number of documents in the job, i.e., the number of Send-Document, Send-URI,
3492 Print-Job, or Print-URI operations that the Printer has accepted for this job, regardless of whether the
3493 document data has reached the Printer object or not.

3494 Implementations supporting the OPTIONAL Create-Job/Send-Document/Send-URI operations SHOULD
3495 support this attribute so that clients can query the number of documents in each job.

3496 4.3.13 output-device-assigned (name(127))

3497 This attribute identifies the output device to which the Printer object has assigned this job. If an output
3498 device implements an embedded Printer object, the Printer object NEED NOT set this attribute. If a print
3499 server implements a Printer object, the value MAY be empty (zero-length string) or not returned until the
3500 Printer object assigns an output device to the job. This attribute is particularly useful when a single Printer
3501 object support multiple devices (so called "fan-out").

3502 4.3.14 Event Time Job Description Attributes **Issue 17**

3503 This section defines the Job Description attributes that indicate the time at which certain events occur for a
3504 job. If the job event has not yet occurred, then the IPP object MUST return the 'no-value' out-of-band value
3505 (see the beginning of Section 4.1). The "time-at-xxx(integer)" attributes represent time as an 'integer'
3506 representing the number of seconds since the device was powered up (informally called "time ticks"). The
3507 "date-time-at-xxx(dateTime)" attributes represent time as 'dateTime' representing date and time (including
3508 an offset from UTC).

3509 In order to populate these attributes, the Printer object copies the value(s) of the following Printer
3510 Description attributes at the time the event occurs:

- 3511 1. the value in the Printer's "printer-up-time" attribute for the "time-at-xxx(integer)" attributes
- 3512 2. the value in the Printer's "printer-current-time" attribute for the "date-time-at-xxx(dateTime)"
3513 attributes.

3514 If the Printer resets its "printer-up-time" attribute to 1 on power-up (see section 4.4.29) and has persistent
3515 jobs, then it MUST change all of jobs' "time-at-xxx(integer)" (time tick) job attributes whose events have
3516 occurred either to:

- 3517 1. 0 to indicate that the event happened before the most recent power up OR
- 3518 2. the negative of the number of seconds before the most recent power-up that the event took place,
3519 though the negative number NEED NOT reflect the exact number of seconds.

3520 If a client queries a "time-at-xxx(integer)" time tick Job attribute and finds the value to be 0 or negative, the
3521 client MUST assume that the event occurred in some life other than the Printer's current life.

3522 Note: A Printer does not change the values of any "date-time-at-xxx(dateTime)" job attributes on power-up.

3523 4.3.14.1 time-at-creation (integer(MIN:MAX))

3524 This REQUIRED attribute indicates the time at which the Job object was created.

3525 4.3.14.2 time-at-processing (integer(MIN:MAX))

3526 This REQUIRED attribute indicates the time at which the Job object first began processing after the create
3527 operation or the most recent Restart-Job operation. The out-of-band 'no-value' value is returned if the job
3528 has not yet been in the 'processing' state (see the beginning of Section 4.1). **Issue 17**

3529 4.3.14.3 time-at-completed (integer(MIN:MAX))

3530 This REQUIRED attribute indicates the time at which the Job object completed (or was cancelled or
3531 aborted). The out-of-band 'no-value' value is returned if the job has not yet completed, been canceled, or
3532 aborted (see the beginning of Section 4.1).

3533 4.3.14.4 job-printer-up-time (integer(1:MAX)) **Issue 17**

3534 This REQUIRED Job Description attribute indicates the amount of time (in seconds) that the Printer
3535 implementation has been up and running. This attribute is an alias for the "printer-up-time" Printer
3536 Description attribute (see Section 4.4.29).

3537 A client MAY request this attribute in a Get-Job-Attributes or Get-Jobs request and use the value returned
3538 in combination with other requested Event Time Job Description Attributes in order to display time
3539 attributes to a user. The difference between this attribute and the 'integer' value of a "time-at-xxx" attribute
3540 is the number of seconds ago that the "time-at-xxx" event occurred. A client can compute the wall-clock
3541 time at which the "time-at-xxx" event occurred by subtracting this difference from the client's wall-clock
3542 time.

3543 4.3.14.5 date-time-at-creation (dateTime) **Issue 17**

3544 This attribute indicates the date and time at which the Job object was created.

3545 4.3.14.6 date-time-at-processing (dateTime) **Issue 17**

3546 This attribute indicates the date and time at which the Job object first began processing after the create
3547 operation or the most recent Restart-Job operation.

3548 4.3.14.7 date-time-at-completed (dateTime) **Issue 17**

3549 This attribute indicates the date and time at which the Job object completed (or was cancelled or aborted).

3550 4.3.15 number-of-intervening-jobs (integer(0:MAX))

3551 This attribute indicates the number of jobs that are "ahead" of this job in the relative chronological order of
3552 expected time to complete (i.e., the current scheduled order). For efficiency, it is only necessary to calculate
3553 this value when an operation is performed that requests this attribute.

3554 4.3.16 job-message-from-operator (text(127))

3555 This attribute provides a message from an operator, system administrator or "intelligent" process to indicate
3556 to the end user the reasons for modification or other management action taken on a job.

3557 4.3.17 Job Size Attributes

3558 This sub-section defines job attributes that describe the size of the job. These attributes are not intended to
3559 be counters; they are intended to be useful routing and scheduling information if known. For these
3560 attributes, the Printer object may try to compute the value if it is not supplied in the create request. Even if
3561 the client does supply a value for these three attributes in the create request, the Printer object MAY choose
3562 to change the value if the Printer object is able to compute a value which is more accurate than the client

3563 supplied value. The Printer object may be able to determine the correct value for these attributes either
3564 right at job submission time or at any later point in time.

3565 4.3.17.1 job-k-octets (integer(0:MAX))

3566 This attribute specifies the total size of the document(s) in K octets, i.e., in units of 1024 octets requested to
3567 be processed in the job. The value MUST be rounded up, so that a job between 1 and 1024 octets MUST
3568 be indicated as being 1, 1025 to 2048 MUST be 2, etc.

3569 This value MUST NOT include the multiplicative factors contributed by the number of copies specified by
3570 the "copies" attribute, independent of whether the device can process multiple copies without making
3571 multiple passes over the job or document data and independent of whether the output is collated or not.
3572 Thus the value is independent of the implementation and indicates the size of the document(s) measured in
3573 K octets independent of the number of copies.

3574 This value MUST also not include the multiplicative factor due to a copies instruction embedded in the
3575 document data. If the document data actually includes replications of the document data, this value will
3576 include such replication. In other words, this value is always the size of the source document data, rather
3577 than a measure of the hardcopy output to be produced.

3578 4.3.17.2 job-impressions (integer(0:MAX))

3579 This attribute specifies the total size in number of impressions of the document(s) being submitted (see the
3580 definition of impression in section 12.2.5).

3581 As with "job-k-octets", this value MUST NOT include the multiplicative factors contributed by the number
3582 of copies specified by the "copies" attribute, independent of whether the device can process multiple copies
3583 without making multiple passes over the job or document data and independent of whether the output is
3584 collated or not. Thus the value is independent of the implementation and reflects the size of the
3585 document(s) measured in impressions independent of the number of copies.

3586 As with "job-k-octets", this value MUST also not include the multiplicative factor due to a copies
3587 instruction embedded in the document data. If the document data actually includes replications of the
3588 document data, this value will include such replication. In other words, this value is always the number of
3589 impressions in the source document data, rather than a measure of the number of impressions to be
3590 produced by the job.

3591 4.3.17.3 job-media-sheets (integer(0:MAX))

3592 This attribute specifies the total number of media sheets to be produced for this job.

3593 Unlike the "job-k-octets" and the "job-impressions" attributes, this value MUST include the multiplicative
3594 factors contributed by the number of copies specified by the "copies" attribute and a 'number of copies'
3595 instruction embedded in the document data, if any. This difference allows the system administrator to
3596 control the lower and upper bounds of both (1) the size of the document(s) with "job-k-octets-supported"
3597 and "job-impressions-supported" and (2) the size of the job with "job-media-sheets-supported".

3598 4.3.18 Job Progress Attributes

3599 This sub-section defines job attributes that describe the progress of the job. These attributes are intended to
3600 be counters. That is, the value for a job that has not started processing **MUST** be 0. When the job's "job-
3601 state" is 'processing' or 'processing-stopped', this value is intended to contain the amount of the job that has
3602 been processed to the time at which the attributes are requested. When the job enters the 'completed',
3603 'canceled', or 'aborted' states, these values are the final values for the job.

3604 4.3.18.1 job-k-octets-processed (integer(0:MAX))

3605 This attribute specifies the total number of octets processed in K octets, i.e., in units of 1024 octets so far.
3606 The value **MUST** be rounded up, so that a job between 1 and 1024 octets inclusive **MUST** be indicated as
3607 being 1, 1025 to 2048 inclusive **MUST** be 2, etc.

3608 For implementations where multiple copies are produced by the interpreter with only a single pass over the
3609 data, the final value **MUST** be equal to the value of the "job-k-octets" attribute. For implementations where
3610 multiple copies are produced by the interpreter by processing the data for each copy, the final value **MUST**
3611 be a multiple of the value of the "job-k-octets" attribute.

3612 4.3.18.2 job-impressions-completed (integer(0:MAX))

3613 This job attribute specifies the number of impressions completed for the job so far. For printing devices,
3614 the impressions completed includes interpreting, marking, and stacking the output.

3615 4.3.18.3 job-media-sheets-completed (integer(0:MAX))

3616 This job attribute specifies the media-sheets completed marking and stacking for the entire job so far
3617 whether those sheets have been processed on one side or on both.

3618 4.3.19 attributes-charset (charset)

3619 This **REQUIRED** attribute is populated using the value in the client supplied "attributes-charset" attribute in
3620 the create request. It identifies the charset (coded character set and encoding method) used by any Job
3621 attributes with attribute syntax 'text' and 'name' that were supplied by the client in the create request. See
3622 Section 3.1.4 for a complete description of the "attributes-charset" operation attribute.

3623 This attribute does not indicate the charset in which the 'text' and 'name' values are stored internally in the
3624 Job object. The internal charset is implementation-defined. The IPP object **MUST** convert from whatever
3625 the internal charset is to that being requested in an operation as specified in Section 3.1.4.

3626 4.3.20 attributes-natural-language (naturalLanguage)

3627 This **REQUIRED** attribute is populated using the value in the client supplied "attributes-natural-language"
3628 attribute in the create request. It identifies the natural language used for any Job attributes with attribute
3629 syntax 'text' and 'name' that were supplied by the client in the create request. See Section 3.1.4 for a

3630 complete description of the "attributes-natural-language" operation attribute. See Sections 4.1.1.2 and
3631 4.1.2.2 for how a Natural Language Override may be supplied explicitly for each 'text' and 'name' attribute
3632 value that differs from the value identified by the "attributes-natural-language" attribute.

3633 4.4 Printer Description Attributes

3634 These attributes form the attribute group called "printer-description". The following table summarizes
3635 these attributes, their syntax, and whether or not they are REQUIRED for a Printer object to support. If
3636 they are not indicated as REQUIRED, they are OPTIONAL. The maximum size in octets for 'text' and
3637 'name' attributes is indicated in parentheses.

3638 Note: How these attributes are set by an Administrator is outside the scope of this IPP/1.1 document.

3639	+-----+-----+-----+

3722	

3723 4.4.1 printer-uri-supported (1setOf uri)

3724 This REQUIRED Printer attribute contains at least one URI for the Printer object. It OPTIONALLY
 3725 contains more than one URI for the Printer object. An administrator determines a Printer object's URI(s)
 3726 and configures this attribute to contain those URIs by some means outside the scope of this IPP/1.1
 3727 document. The precise format of this URI is implementation dependent and depends on the protocol. See
 3728 the next two sections for a description of the "uri-security-supported" and "uri-authentication-supported"
 3729 attributes, both of which are the REQUIRED companion attributes to this "printer-uri-supported" attribute.
 3730 See section 2.4 on Printer object identity and section 8.2 on security and URIs for more information.

3731 4.4.2 uri-authentication-supported (1setOf type2 keyword) **Issue 2**

3732 This REQUIRED Printer attribute MUST have the same cardinality (contain the same number of values) as
 3733 the "printer-uri-supported" attribute. This attribute identifies the Client Authentication mechanism

3734 associated with each URI listed in the "printer-uri-supported" attribute. The Printer object uses the specified
3735 mechanism to identify the authenticated user (see section 8.3) . The "i th" value in "uri-authentication-
3736 supported" corresponds to the "i th" value in "printer-uri-supported" and it describes the authentication
3737 mechanisms used by the Printer when accessed via that URI. See [IPP-PRO] for more details on Client
3738 Authentication.

3739 The following standard keyword values are defined:

3740 'none': There is no authentication mechanism associated with the URI. The Printer object assumes that
3741 the authenticated user is "anonymous".
3742 'requesting-user-name': When a client performs an operation whose target is the associated URI, the
3743 Printer object assumes that the authenticated user is specified by the "requesting-user-name"
3744 Operation attribute (see section 8.3). If the "requesting-user-name" attribute is absent in a request,
3745 the Printer object assumes that the authenticated user is "anonymous".
3746 'basic': When a client performs an operation whose target is the associated URI, the Printer object
3747 challenges the client with HTTP basic authentication. The Printer object assumes that the
3748 authenticated user is the name received via the basic authentication mechanism.
3749 'digest': When a client performs an operation whose target is the associated URI, the Printer object
3750 challenges the client with HTTP digest authentication. The Printer object assumes that the
3751 authenticated user is the name received via the digest authentication mechanism.
3752 'certificate': When a client performs an operation whose target is the associated URI, the Printer object
3753 expects the client to provide a certificate. The Printer object assumes that the authenticated user is
3754 the textual name contained within the certificate.

3755 4.4.3 uri-security-supported (1setOf type2 keyword)

3756 This REQUIRED Printer attribute MUST have the same cardinality (contain the same number of values) as
3757 the "printer-uri-supported" attribute. This attribute identifies the security mechanisms used for each URI
3758 listed in the "printer-uri-supported" attribute. The "i th" value in "uri-security-supported" corresponds to
3759 the "i th" value in "printer-uri-supported" and it describes the security mechanisms used for accessing the
3760 Printer object via that URI. See [IPP-PRO] for more details on security mechanisms.

3761 The following standard keyword values are defined:

3762 'none': There are no secure communication channel protocols in use for the given URI.
3763 'ssl3': SSL3 [SSL] is the secure communications channel protocol in use for the given URI.
3764 'tls': TLS [RFC2246] is the secure communications channel protocol in use for the given URI.
3765

3766 This attribute is orthogonal to the definition of a Client Authentication mechanism. Specifically, 'none'
3767 does not exclude Client Authentication. See section 4.4.2. [Issue 21](#)

3768 Consider the following example. For a single Printer object, an administrator configures the "printer-uri-
3769 supported", "uri-authentication-supported" and "uri-security-supported" attributes as follows:

3770 "printer-uri-supported": 'xxx://acme.com/open-use-printer', 'xxx://acme.com/restricted-use-printer',
3771 'xxx://acme.com/private-printer'
3772 "uri-authentication-supported": 'none', 'digest', 'basic'

3773 "uri-security-supported": 'none', 'none', 'tls'
3774

3775 Note: 'xxx' is not a valid scheme. See the IPP/1.1 "Transport and Encoding" document [IPP-PRO] for the
3776 actual URI schemes to be used in object target attributes.

3777 In this case, one Printer object has three URIs.

- 3778 - For the first URI, 'xxx://acme.com/open-use-printer', the value 'none' in "uri-security-supported"
3779 indicates that there is no secure channel protocol configured to run under HTTP. The value of 'none'
3780 in "uri-authentication-supported" indicates that all users are 'anonymous'. There will be no
3781 challenge and the Printer will ignore "requesting-user-name".
- 3782 - For the second URI, 'xxx://acme.com/restricted-use-printer', the value 'none' in "uri-security-
3783 supported" indicates that there is no secure channel protocol configured to run under HTTP. The
3784 value of 'digest' in "uri-authentication-supported" indicates that the Printer will issue a challenge and
3785 that the Printer will use the name supplied by the digest mechanism to determine the authenticated
3786 user (see section 8.3).
- 3787 - For the third URI, 'xxx://acme.com/private-printer', the value 'tls' in "uri-security-supported" indicates
3788 that TLS is being used to secure the channel. The client SHOULD be prepared to use TLS framing
3789 to negotiate an acceptable ciphersuite to use while communicating with the Printer object. In this
3790 case, the name implies the use of a secure communications channel, but the fact is made explicit by
3791 the presence of the 'tls' value in "uri-security-supported". The client does not need to resort to
3792 understanding which security it must use by following naming conventions or by parsing the URI to
3793 determine which security mechanisms are implied. The value of 'basic' in "uri-authentication-
3794 supported" indicates that the Printer will issue a challenge and that the Printer will use the name
3795 supplied by the digest mechanism to determine the authenticated user (see section 8.3) . Because
3796 this challenge occurs in a tls session, the channel is secure.
3797

3798 It is expected that many IPP Printer objects will be configured to support only one channel (either
3799 configured to use TLS access or not) and only one authentication mechanism. Such Printer objects only
3800 have one URI listed in the "printer-uri-supported" attribute. No matter the configuration of the Printer
3801 object (whether it has only one URI or more than one URI), a client MUST supply only one URI in the
3802 target "printer-uri" operation attribute.

3803 4.4.4 printer-name (name(127))

3804 This REQUIRED Printer attribute contains the name of the Printer object. It is a name that is more end-
3805 user friendly than a URI. An administrator determines a printer's name and sets this attribute to that name.
3806 This name may be the last part of the printer's URI or it may be unrelated. In non-US-English locales, a
3807 name may contain characters that are not allowed in a URI.

3808 4.4.5 printer-location (text(127))

3809 This Printer attribute identifies the location of the device. This could include things like: "in Room 123A,
3810 second floor of building XYZ".

3811 4.4.6 printer-info (text(127))

3812 This Printer attribute identifies the descriptive information about this Printer object. This could include
3813 things like: "This printer can be used for printing color transparencies for HR presentations", or "Out of
3814 courtesy for others, please print only small (1-5 page) jobs at this printer", or even "This printer is going
3815 away on July 1, 1997, please find a new printer".

3816 4.4.7 printer-more-info (uri)

3817 This Printer attribute contains a URI used to obtain more information about this specific Printer object. For
3818 example, this could be an HTTP type URI referencing an HTML page accessible to a Web Browser. The
3819 information obtained from this URI is intended for end user consumption. Features outside the scope of IPP
3820 can be accessed from this URI. The information is intended to be specific to this printer instance and site
3821 specific services (e.g. job pricing, services offered, end user assistance). The device manufacturer may
3822 initially populate this attribute.

3823 4.4.8 printer-driver-installer (uri)

3824 This Printer attribute contains a URI to use to locate the driver installer for this Printer object. This
3825 attribute is intended for consumption by automata. The mechanics of print driver installation is outside the
3826 scope of this IPP/1.1 document. The device manufacturer may initially populate this attribute.

3827 4.4.9 printer-make-and-model (text(127))

3828 This Printer attribute identifies the make and model of the device. The device manufacturer may initially
3829 populate this attribute.

3830 4.4.10 printer-more-info-manufacturer (uri)

3831 This Printer attribute contains a URI used to obtain more information about this type of device. The
3832 information obtained from this URI is intended for end user consumption. Features outside the scope of
3833 IPP can be accessed from this URI (e.g., latest firmware, upgrades, print drivers, optional features available,
3834 details on color support). The information is intended to be germane to this printer without regard to site
3835 specific modifications or services. The device manufacturer may initially populate this attribute.

3836 4.4.11 printer-state (type1 enum)

3837 This REQUIRED Printer attribute identifies the current state of the device. The "printer-state reasons"
3838 attribute augments the "printer-state" attribute to give more detailed information about the Printer in the
3839 given printer state.

3840 A Printer object need only update this attribute before responding to an operation which requests the
3841 attribute; the Printer object NEED NOT update this attribute continually, since asynchronous event
3842 notification is not part of IPP/1.1. A Printer NEED NOT implement all values if they are not applicable to
3843 a given implementation.

3844 The following standard enum values are defined:

3845	Value	Symbolic Name and Description
3846		
3847	'3'	'idle': Indicates that new jobs can start processing without waiting. Issue 31
3848	'4'	'processing': Indicates that jobs are processing; new jobs will wait before processing. Issue
3849		31
3850	'5'	'stopped': Indicates that no jobs can be processed and intervention is
3851		required. Issue 31

3852 Values of "printer-state-reasons", such as 'spool-area-full' and 'stopped-partly', MAY be used to provide
3853 further information. **Issue 31**

3854 4.4.12 printer-state-reasons (1setOf type2 keyword)

3855 This REQUIRED Printer attribute supplies additional detail about the device's state. Some of the these
3856 value definitions indicate conformance requirements; the rest are OPTIONAL. **Issue 30**

3857 Each keyword value MAY have a suffix to indicate its level of severity. The three levels are: report (least
3858 severe), warning, and error (most severe).

- 3859 - 'report': This suffix indicates that the reason is a "report". An implementation may choose to omit
3860 some or all reports. Some reports specify finer granularity about the printer state; others serve as a
3861 precursor to a warning. A report MUST contain nothing that could affect the printed output.
- 3862 - 'warning': This suffix indicates that the reason is a "warning". An implementation may choose to omit
3863 some or all warnings. Warnings serve as a precursor to an error. A warning MUST contain nothing
3864 that prevents a job from completing, though in some cases the output may be of lower quality.
- 3865 - 'error': This suffix indicates that the reason is an "error". An implementation MUST include all
3866 errors. If this attribute contains one or more errors, printer MUST be in the stopped state.

3867

3868 If the implementation does not add any one of the three suffixes, all parties MUST assume that the reason is
3869 an "error".

3870 If a Printer object controls more than one output device, each value of this attribute MAY apply to one or
3871 more of the output devices. An error on one output device that does not stop the Printer object as a whole
3872 MAY appear as a warning in the Printer's "printer-state-reasons" attribute. If the "printer-state" for such a
3873 Printer has a value of 'stopped', then there MUST be an error reason among the values in the "printer-state-
3874 reasons" attribute.

3875 The following standard keyword values are defined:

- 3876 'other': The device has detected an error other than one listed in this document.
- 3877 'none': There are not reasons. This state reason is semantically equivalent to "printer-state-reasons"
3878 without any value and MUST be used, since the 1setOf attribute syntax requires at least one value.
- 3879 'media-needed': A tray has run out of media.
- 3880 'media-jam': The device has a media jam.

- 3881 'moving-to-paused': Someone has paused the Printer object using the Pause-Printer operation (see
3882 section 3.2.7) or other means, but the device(s) are taking an appreciable time to stop. Later, when
3883 all output has stopped, the "printer-state" becomes 'stopped', and the 'paused' value replaces the
3884 'moving-to-paused' value in the "printer-state-reasons" attribute. This value MUST be supported, if
3885 the Pause-Printer operation is supported and the implementation takes significant time to pause a
3886 device in certain circumstances. **Issue 30**
- 3887 'paused': Someone has paused the Printer object using the Pause-Printer operation (see section 3.2.7) or
3888 other means and the Printer object's "printer-state" is 'stopped'. In this state, a Printer MUST NOT
3889 produce printed output, but it MUST perform other operations requested by a client. If a Printer had
3890 been printing a job when the Printer was paused, the Printer MUST resume printing that job when
3891 the Printer is no longer paused and leave no evidence in the printed output of such a pause. This
3892 value MUST be supported, if the Pause-Printer operation is supported. **Issue 30**
- 3893 'shutdown': Someone has removed a Printer object from service, and the device may be powered down
3894 or physically removed. In this state, a Printer object MUST NOT produce printed output, and unless
3895 the Printer object is realized by a print server that is still active, the Printer object MUST perform no
3896 other operations requested by a client, including returning this value. If a Printer object had been
3897 printing a job when it was shutdown, the Printer NEED NOT resume printing that job when the
3898 Printer is no longer shutdown. If the Printer resumes printing such a job, it may leave evidence in
3899 the printed output of such a shutdown, e.g. the part printed before the shutdown may be printed a
3900 second time after the shutdown.
- 3901 'connecting-to-device': The Printer object has scheduled a job on the output device and is in the process
3902 of connecting to a shared network output device (and might not be able to actually start printing the
3903 job for an arbitrarily long time depending on the usage of the output device by other servers on the
3904 network).
- 3905 'timed-out': The server was able to connect to the output device (or is always connected), but was unable
3906 to get a response from the output device.
- 3907 'stopping': The Printer object is in the process of stopping the device and will be stopped in a while.
3908 When the device is stopped, the Printer object will change the Printer object's state to 'stopped'. The
3909 'stopping-warning' reason is never an error, even for a Printer with a single output device. When an
3910 output-device ceases accepting jobs, the Printer will have this reason while the output device
3911 completes printing.
- 3912 'stopped-partly': When a Printer object controls more than one output device, this reason indicates that
3913 one or more output devices are stopped. If the reason is a report, fewer than half of the output
3914 devices are stopped. If the reason is a warning, fewer than all of the output devices are stopped.
- 3915 'toner-low': The device is low on toner.
- 3916 'toner-empty': The device is out of toner.
- 3917 'spool-area-full': The limit of persistent storage allocated for spooling has been reached. The Printer is
3918 temporarily unable to accept more jobs. The Printer will remove this value when it is able to accept
3919 more jobs. This value SHOULD be used by a non-spooling Printer that only accepts one or a small
3920 number jobs at a time or a spooling Printer that has filled the spool space. **Issue 20 Issue 30 and**
3921 **Issue 31**
- 3922 'cover-open': One or more covers on the device are open.
- 3923 'interlock-open': One or more interlock devices on the printer are unlocked.
- 3924 'door-open': One or more doors on the device are open.
- 3925 'input-tray-missing': One or more input trays are not in the device.

3926 'media-low': At least one input tray is low on media.
3927 'media-empty': At least one input tray is empty.
3928 'output-tray-missing': One or more output trays are not in the device
3929 'output-area-almost-full': One or more output area is almost full (e.g. tray, stacker, collator).
3930 'output-area-full': One or more output area is full. (e.g. tray, stacker, collator)
3931 'marker-supply-low': The device is low on at least one marker supply. (e.g. toner, ink, ribbon)
3932 'marker-supply-empty': The device is out of at least one marker supply. (e.g. toner, ink, ribbon)
3933 'marker-waste-almost-full': The device marker supply waste receptacle is almost full.
3934 'marker-waste-full': The device marker supply waste receptacle is full.
3935 'fuser-over-temp': The fuser temperature is above normal.
3936 'fuser-under-temp': The fuser temperature is below normal.
3937 'opc-near-eol': The optical photo conductor is near end of life.
3938 'opc-life-over': The optical photo conductor is no longer functioning.
3939 'developer-low': The device is low on developer.
3940 'developer-empty': The device is out of developer.
3941 'interpreter-resource-unavailable': An interpreter resource is unavailable (i.e. font, form)
3942

3943 4.4.13 printer-state-message (text(MAX))

3944 This Printer attribute specifies the additional information about the printer state and printer state reasons in
3945 human readable text. If the Printer object supports this attribute, the Printer object MUST be able to
3946 generate this message in any of the natural languages identified by the Printer's "generated-natural-
3947 language-supported" attribute (see the "attributes-natural-language" operation attribute specified in Section
3948 3.1.4.1).

3949 4.4.14 ipp-versions-supported (1setOf type2 keyword) **Issue 36**

3950 This REQUIRED attribute identifies the IPP protocol version(s) that this Printer supports, including major
3951 and minor versions, i.e., the version numbers for which this Printer implementation meets the conformance
3952 requirements. For version number validation, the Printer matches the (two-octet binary) "version-number"
3953 parameter supplied by the client in each request (see sections 3.1.1 and 3.1.8) with the (US-ASCII) keyword
3954 values of this attribute.

3955 The following standard keyword values are defined:

3956 '1.0': Meets the conformance requirement of IPP version 1.0 as specified in RFC 2566 [RFC2566] and
3957 RFC 2565 [RFC2565] including any extensions registered according to Section 6 and any extension
3958 defined in this version or any future version of the IPP "Model and Semantics" document or the IPP
3959 "Encoding and Transport" document following the rules, if any, when the "version-number"
3960 parameter is '1.0'.
3961 '1.1': Meets the conformance requirement of IPP version 1.1 as specified in this document and [IPP-
3962 PRO] including any extensions registered according to Section 6 and any extension defined in any
3963 future versions of the IPP "Model and Semantics" document or the IPP Encoding and Transport
3964 document following the rules, if any, when the "version-number" parameter is '1.1'.

3965 4.4.15 operations-supported (1setOf type2 enum)

3966 This REQUIRED Printer attribute specifies the set of supported operations for this Printer object and
3967 contained Job objects.

3968 This attribute is encoded as any other enum attribute syntax according to [IPP-PRO] as 32-bits. However,
3969 all 32-bit enum values for this attribute MUST NOT exceed 0x00008FFF, since these same values are also
3970 passed in two octets in the "operation-id" parameter (see section 3.1.1) in each Protocol request with the
3971 two high order octets omitted in order to indicate the operation being performed [IPP-PRO].

3972 The following standard enum and "operation-id" (see section 3.1.2) values are defined:

3973	Value	Operation Name
3974	-----	-----
3975		
3976	0x0000	reserved, not used
3977	0x0001	reserved, not used
3978	0x0002	Print-Job
3979	0x0003	Print-URI
3980	0x0004	Validate-Job
3981	0x0005	Create-Job
3982	0x0006	Send-Document
3983	0x0007	Send-URI
3984	0x0008	Cancel-Job
3985	0x0009	Get-Job-Attributes
3986	0x000A	Get-Jobs
3987	0x000B	Get-Printer-Attributes
3988	0x000C	Hold-Job
3989	0x000D	Release-Job
3990	0x000E	Restart-Job
3991	0x000F	reserved for a future operation
3992	0x0010	Pause-Printer
3993	0x0011	Resume-Printer
3994	0x0012	Purge-Jobs
3995	0x00013-0x3FFF	reserved for future operations
3996	0x4000-0x8FFF	reserved for private extensions
3997		

3998 The reserved block for private extensions allows for vendors to implement private extensions that are
3999 guaranteed to not conflict with future registered extensions. However, there is no guarantee that two or
4000 more private extensions will not conflict.

4001 4.4.16 multiple-document-jobs-supported (boolean) **Issue 34**

4002 This Printer attribute indicates whether or not the Printer supports more than one document per job, i.e.,
4003 more than one Send-Document or Send-Data operation with document data. If the Printer supports the
4004 Create-Job and Send-Document operations (see section 3.2.4 and 3.3.1), it MUST support this attribute.

4005 4.4.17 charset-configured (charset)

4006 This REQUIRED Printer attribute identifies the charset that the Printer object has been configured to
4007 represent 'text' and 'name' Printer attributes that are set by the operator, system administrator, or
4008 manufacturer, i.e., for "printer-name" (name), "printer-location" (text), "printer-info" (text), and "printer-
4009 make-and-model" (text). Therefore, the value of the Printer object's "charset-configured" attribute MUST
4010 also be among the values of the Printer object's "charset-supported" attribute.

4011 4.4.18 charset-supported (1setOf charset)

4012 This REQUIRED Printer attribute identifies the set of charsets that the Printer and contained Job objects
4013 support in attributes with attribute syntax 'text' and 'name'. At least the value 'utf-8' MUST be present, since
4014 IPP objects MUST support the UTF-8 [RFC2279] charset. If a Printer object supports a charset, it means
4015 that for all attributes of syntax 'text' and 'name' the IPP object MUST (1) accept the charset in requests and
4016 return the charset in responses as needed.

4017 If more charsets than UTF-8 are supported, the IPP object MUST perform charset conversion between the
4018 charsets as described in Section 3.1.4.2.

4019 4.4.19 natural-language-configured (naturalLanguage)

4020 This REQUIRED Printer attribute identifies the natural language that the Printer object has been configured
4021 to represent 'text' and 'name' Printer attributes that are set by the operator, system administrator, or
4022 manufacturer, i.e., for "printer-name" (name), "printer-location" (text), "printer-info" (text), and "printer-
4023 make-and-model" (text). When returning these Printer attributes, the Printer object MAY return them in the
4024 configured natural language specified by this attribute, instead of the natural language requested by the
4025 client in the "attributes-natural-language" operation attribute. See Section 3.1.4.1 for the specification of
4026 the OPTIONAL multiple natural language support. Therefore, the value of the Printer object's "natural-
4027 language-configured" attribute MUST also be among the values of the Printer object's "generated-natural-
4028 language-supported" attribute.

4029 4.4.20 generated-natural-language-supported (1setOf naturalLanguage)

4030 This REQUIRED Printer attribute identifies the natural language(s) that the Printer object and contained
4031 Job objects support in attributes with attribute syntax 'text' and 'name'. The natural language(s) supported
4032 depends on implementation and/or configuration. Unlike charsets, IPP objects MUST accept requests with
4033 any natural language or any Natural Language Override whether the natural language is supported or not.

4034 If a Printer object supports a natural language, it means that for any of the attributes for which the Printer or
4035 Job object generates messages, i.e., for the "job-state-message" and "printer-state-message" attributes and
4036 Operation Messages (see Section 3.1.5) in operation responses, the Printer and Job objects MUST be able
4037 to generate messages in any of the Printer's supported natural languages. See section 3.1.4 for the definition
4038 of 'text' and 'name' attributes in operation requests and responses.

4039 Note: A Printer object that supports multiple natural languages, often has separate catalogs of messages,
4040 one for each natural language supported.

4041 4.4.21 document-format-default (mimeMediaType)

4042 This REQUIRED Printer attribute identifies the document format that the Printer object has been
4043 configured to assume if the client does not supply a "document-format" operation attribute in any of the
4044 operation requests that supply document data. The standard values for this attribute are Internet Media
4045 types (sometimes called MIME types). For further details see the description of the 'mimeMediaType'
4046 attribute syntax in Section 4.1.9.

4047 4.4.22 document-format-supported (1setOf mimeMediaType)

4048 This REQUIRED Printer attribute identifies the set of document formats that the Printer object and
4049 contained Job objects can support. For further details see the description of the 'mimeMediaType' attribute
4050 syntax in Section 4.1.9.

4051 4.4.23 printer-is-accepting-jobs (boolean)

4052 This REQUIRED Printer attribute indicates whether the printer is currently able to accept jobs, i.e., is
4053 accepting Print-Job, Print-URI, and Create-Job requests. If the value is 'true', the printer is accepting jobs.
4054 If the value is 'false', the Printer object is currently rejecting any jobs submitted to it. In this case, the
4055 Printer object returns the 'server-error-not-accepting-jobs' status code.

4056 This value is independent of the "printer-state" and "printer-state-reasons" attributes because its value does
4057 not affect the current job; rather it affects future jobs. This attribute, when 'false', causes the Printer to
4058 reject jobs even when the "printer-state" is 'idle' or, when 'true', causes the Printer object to accept jobs
4059 even when the "printer-state" is 'stopped'.

4060 4.4.24 queued-job-count (integer(0:MAX))

4061 This REQUIRED Printer attribute contains a count of the number of jobs that are either 'pending',
4062 'processing', 'pending-held', or 'processing-stopped' and is set by the Printer object. **Issue 29**

4063 4.4.25 printer-message-from-operator (text(127))

4064 This Printer attribute provides a message from an operator, system administrator or "intelligent" process to
4065 indicate to the end user information or status of the printer, such as why it is unavailable or when it is
4066 expected to be available.

4067 4.4.26 color-supported (boolean)

4068 This Printer attribute identifies whether the device is capable of any type of color printing at all, including
4069 highlight color. All document instructions having to do with color are embedded within the document PDL
4070 (none are external IPP attributes in IPP/1.1).

4071 Note: end-users are able to determine the nature and details of the color support by querying the "printer-
4072 more-info-manufacturer" Printer attribute.

4073 4.4.27 reference-uri-schemes-supported (1setOf uriScheme)

4074 This Printer attribute specifies which URI schemes are supported for use in the "document-uri" operation
4075 attribute of the Print-URI or Send-URI operation. If a Printer object supports these optional operations, it
4076 MUST support the "reference-uri-schemes-supported" Printer attribute with at least the following schemed
4077 URI value:

4078 'ftp': The Printer object will use an FTP 'get' operation as defined in RFC 2228 [RFC2228] using FTP
4079 URLs as defined by [RFC2396] and[RFC2316].
4080

4081 The Printer object MAY OPTIONALLY support other URI schemes (see section 4.1.6).

4082 4.4.28 pdl-override-supported (type2 keyword)

4083 This REQUIRED Printer attribute expresses the ability for a particular Printer implementation to either
4084 attempt to override document data instructions with IPP attributes or not.

4085 This attribute takes on the following values:

- 4086 - 'attempted': This value indicates that the Printer object attempts to make the IPP attribute values take
4087 precedence over embedded instructions in the document data, however there is no guarantee.
- 4088 - 'not-attempted': This value indicates that the Printer object makes no attempt to make the IPP attribute
4089 values take precedence over embedded instructions in the document data.
4090

4091 Section 15 contains a full description of how this attribute interacts with and affects other IPP attributes,
4092 especially the "ipp-attribute-fidelity" attribute.

4093 4.4.29 printer-up-time (integer(1:MAX))

4094 This REQUIRED Printer attribute indicates the amount of time (in seconds) that this Printer instance has
4095 been up and running. The value is a monotonically increasing value starting from 1 when the Printer object
4096 is started-up (initialized, booted, etc.). This value is used to populate the Event Time Job Description Job
4097 attributes "time-at-creation", "time-at-processing", and "time-at-completed" (see section 4.3.14).

4098 If the Printer object goes down at some value 'n', and comes back up, the implementation MAY:

- 4099 1. Know how long it has been down, and resume at some value greater than 'n', or
- 4100 2. Restart from 1.

4101 In other words, if the device or devices that the Printer object is representing are restarted or power cycled,
4102 the Printer object MAY continue counting this value or MAY reset this value to 1 depending on
4103 implementation. However, if the Printer object software ceases running, and restarts without knowing the
4104 last value for "printer-up-time", the implementation MUST reset this value to 1. If this value is reset and
4105 the Printer has persistent jobs, the Printer MUST reset the "time-at-xxx(integer) Event Time Job
4106 Description attributes according to Section 4.3.14. **Issue 17** An implementation MAY use both
4107 implementation alternatives, depending on warm versus cold start, respectively.

4108 4.4.30 printer-current-time (dateTime)

4109 This Printer attribute indicates the current date and time. This value is used to populate the Event Time Job
4110 Description attributes: "time-at-creation", "time-at-processing", and "time-at-completed" (see Section
4111 4.3.14).

4112 The date and time is obtained on a "best efforts basis" and does not have to be that precise in order to work
4113 in practice. A Printer implementation sets the value of this attribute by obtaining the date and time via
4114 some implementation-dependent means, such as getting the value from a network time server, initialization
4115 at time of manufacture, or setting by an administrator. See [IPP-IIG] for examples. If an implementation
4116 supports this attribute and the implementation knows that it has not yet been set, then the implementation
4117 MUST return the value of this attribute using the out-of-band 'no-value' meaning not configured. See the
4118 beginning of section 4.1. **Issue 17**

4119 The time zone of this attribute NEED NOT be the time zone used by people located near the Printer object
4120 or device. The client MUST NOT expect that the time zone of any received 'dateTime' value to be in the
4121 time zone of the client or in the time zone of the people located near the printer. **Issue 17**

4122 The client SHOULD display any dateTime attributes to the user in client local time by converting the
4123 'dateTime' value returned by the server to the time zone of the client, rather than using the time zone
4124 returned by the Printer in attributes that use the 'dateTime' attribute syntax. **Issue 17**

4125 4.4.31 multiple-operation-time-out (integer(1:MAX))

4126 This Printer attributes identifies the minimum time (in seconds) that the Printer object waits for additional
4127 Send-Document or Send-URI operations to follow a still-open multi-document Job object before taking
4128 any recovery actions, such as the ones indicated in section 3.3.1. If the Printer object supports the Create-
4129 Job and Send-Document operations (see section 3.2.4 and 3.3.1), it MUST support this attribute.

4130 It is RECOMMENDED that vendors supply a value for this attribute that is between 60 and 240 seconds.
4131 An implementation MAY allow a system administrator to set this attribute (by means outside this IPP/1.1
4132 document). If so, the system administrator MAY be able to set values outside this range.

4133 4.4.32 compression-supported (1setOf type3 keyword)

4134 This REQUIRED Printer attribute identifies the set of supported compression algorithms for document
4135 data. Compression only applies to the document data; compression does not apply to the encoding of the
4136 IPP operation itself. The supported values are used to validate the client supplied "compression" operation
4137 attributes in Print-Job, Send-Document, and Send-URI requests. **Issue 28**

4138 Standard values are :

- 4139 'none': no compression is used.
 - 4140 'deflate': ZIP public domain inflate/deflate) compression technology
 - 4141 'gzip' GNU zip compression technology described in RFC 1952 [RFC1952].
 - 4142 'compress': UNIX compression technology
- 4143

4144 4.4.33 job-k-octets-supported (rangeOfInteger(0:MAX))

4145 This Printer attribute specifies the upper and lower bounds of total sizes of jobs in K octets, i.e., in units of
4146 1024 octets. The supported values are used to validate the client supplied "job-k-octets" operation attributes
4147 in create requests. The corresponding job description attribute "job-k-octets" is defined in section 4.3.17.1.

4148 4.4.34 job-impressions-supported (rangeOfInteger(0:MAX))

4149 This Printer attribute specifies the upper and lower bounds for the number of impressions per job. The
4150 supported values are used to validate the client supplied "job-impressions" operation attributes in create
4151 requests. The corresponding job description attribute "job-impressions" is defined in section 4.3.17.2.

4152 4.4.35 job-media-sheets-supported (rangeOfInteger(0:MAX))

4153 This Printer attribute specifies the upper and lower bounds for the number of media sheets per job. The
4154 supported values are used to validate the client supplied "job-media-sheets" operation attributes in create
4155 requests. The corresponding Job attribute "job-media-sheets" is defined in section 4.3.17.3.

4156 4.4.36 pages-per-minute (integer(0:MAX))

4157 This Printer attributes specifies the nominal number of pages per minute to the nearest whole number which
4158 may be generated by this printer (e.g., simplex, black-and-white). This attribute is informative, not a
4159 service guarantee. Generally, it is the value used in the marketing literature to describe the device.

4160 A value of 0 indicates a device that takes more than two minutes to process a page.

4161 4.4.37 pages-per-minute-color (integer(0:MAX))

4162 This Printer attributes specifies the nominal number of pages per minute to the nearest whole number which
4163 may be generated by this printer when printing color (e.g., simplex, color). For purposes of this attribute,
4164 "color" means the same as for the "color-supported" attribute, namely, the device is capable of any type of
4165 color printing at all, including highlight color. This attribute is informative, not a service guarantee.
4166 Generally, it is the value used in the marketing literature to describe the color capabilities of this device.

4167 A value of 0 indicates a device that takes more than two minutes to process a page.

4168 If a color device has several color modes, it MAY use the pages-per-minute value for this attribute that
4169 corresponds to the mode that produces the highest number.

4170 Black and white only printers MUST NOT support this attribute. If this attribute is present, then the "color-
4171 supported" Printer description attribute MUST be present and have a 'true' value.

4172 The values of these two attributes returned by the Get-Printer-Attributes operation MAY be affected by the
4173 "document-format" attribute supplied by the client in the Get-Printer-Attributes request. In other words, the
4174 implementation MAY have different speeds depending on the document format being processed. See
4175 section 3.2.5.1 Get-Printer-Attributes.

4176 5. Conformance

4177 This section describes conformance issues and requirements. This document introduces model entities such
4178 as objects, operations, attributes, attribute syntaxes, and attribute values. These conformance sections
4179 describe the conformance requirements which apply to these model entities.

4180 5.1 Client Conformance Requirements

4181 This section describes the conformance requirements for a client (see section 2.1), whether it be:

- 4182 1. contained within software controlled by an end user, e.g. activated by the "Print" menu item in an
4183 application that sends IPP requests or
- 4184 2. the print server component that sends IPP requests to either an output device or another
4185 "downstream" print server. **Issue 4**

4186 A conforming client **MUST** support all **REQUIRED** operations as defined in this document. For each
4187 attribute included in an operation request, a conforming client **MUST** supply a value whose type and value
4188 syntax conforms to the requirements of the Model document as specified in Sections 3 and 4. A
4189 conforming client **MAY** supply any registered extensions and/or private extensions in an operation request,
4190 as long as they meet the requirements in Section 6.

4191 Otherwise, there are no conformance requirements placed on the user interfaces provided by IPP clients or
4192 their applications. For example, one application might not allow an end user to submit multiple documents
4193 per job, while another does. One application might first query a Printer object in order to supply a graphical
4194 user interface (GUI) dialogue box with supported and default values whereas a different implementation
4195 might not.

4196 When sending a request, an IPP client **NEED NOT** supply any attributes that are indicated as
4197 **OPTIONALLY** supplied by the client.

4198 A client **MUST** be able to accept any of the attribute syntaxes defined in Section 4.1, including their full
4199 range, that may be returned to it in a response from a Printer object. In particular for each attribute that the
4200 client supports whose attribute syntax is 'text', the client **MUST** accept and process both the
4201 'textWithoutLanguage' and 'textWithLanguage' forms. Similarly, for each attribute that the client supports
4202 whose attribute syntax is 'name', the client **MUST** accept and process both the 'nameWithoutLanguage' and
4203 'nameWithLanguage' forms. For presentation purposes, truncation of long attribute values is not
4204 recommended. A recommended approach would be for the client implementation to allow the user to scroll
4205 through long attribute values.

4206 A response **MAY** contain attribute groups, attributes, attribute syntaxes, values, and status codes that the
4207 client does not expect. Therefore, a client implementation **MUST** gracefully handle such responses and not
4208 refuse to inter-operate with a conforming Printer that is returning registered or private extensions, including
4209 attribute groups, attributes, attribute syntaxes, attribute values, and status codes that conform to Section 6.
4210 Clients may choose to ignore any parameters, attributes, attribute syntaxes, or values that they do not
4211 understand. **Issue 25 and Issue 26**

4212 While a client is sending data to a printer, it SHOULD do its best to prevent a channel from being closed by
 4213 a lower layer when the channel is blocked (i.e. flow-controlled off) for whatever reason, e.g. 'out of paper'
 4214 or 'job ahead hasn't freed up enough memory'. However, the layer that launched the print submission (e.g.
 4215 an end user) MAY close the channel in order to cancel the job. When a client closes a channel, a Printer
 4216 MAY print all or part of the received portion of the document. See the "Encoding and Transport" document
 4217 [IPP-PRO] for more details. **Issue 4 and Issue 5**

4218 A client MUST support Client Authentication as defined in the IPP/1.1 Encoding and Transport document
 4219 [IPP-PRO]. A client SHOULD support Operation Privacy and Server Authentication as defined in the
 4220 IPP/1.1 Encoding and Transport document [IPP-PRO]. See also section 8 of this document. **Issue 32**

4221 5.2 IPP Object Conformance Requirements

4222 This section specifies the conformance requirements for conforming implementations of IPP objects (see
 4223 section 2). These requirements apply to an IPP object whether it is:

4224 (1) an (embedded) device component that accepts IPP requests and controls the device or

4225 (2) a component of a print server that accepts IPP requests (where the print server control one or
 4226 more networked devices using IPP or other protocols). **Issue 4**

4227 5.2.1 Objects

4228 Conforming implementations MUST implement all of the model objects as defined in this document in the
 4229 indicated sections:

4230 Section 2.1 - Printer Object

4231 Section 2.2 - Job Object

4232 5.2.2 Operations

4233 Conforming IPP object implementations MUST implement all of the REQUIRED model operations,
 4234 including REQUIRED responses, as defined in this document in the indicated sections:

4235 For a Printer object:

4236 Print-Job (section 3.2.1) REQUIRED

4237 Print-URI (section 3.2.2) OPTIONAL

4238 Validate-Job (section 3.2.3) REQUIRED

4239 Create-Job (section 3.2.4) OPTIONAL

4240 Get-Printer-Attributes (section 3.2.5) REQUIRED

4241 Get-Jobs (section 3.2.6) REQUIRED

4242 Pause-Printer (section 3.2.7) OPTIONAL

4243 Resume-Printer (section 3.2.8) OPTIONAL

4244 Purge-Jobs (section 3.2.9) OPTIONAL

4245

4246 For a Job object:

4247 Send-Document (section 3.3.1) OPTIONAL

4248	Send-URI (section 3.3.2)	OPTIONAL
4249	Cancel-Job (section 3.3.3)	REQUIRED
4250	Get-Job-Attributes (section 3.3.4)	REQUIRED
4251	Hold-Job (section 3.3.5)	OPTIONAL
4252	Release-Job (section 3.3.6)	OPTIONAL
4253	Restart-Job (section 3.3.7)	OPTIONAL
4254		

4255 Conforming IPP objects **MUST** support all **REQUIRED** operation attributes and all values of such
4256 attributes if so indicated in the description. Conforming IPP objects **MUST** ignore all unsupported or
4257 unknown operation attributes or operation attribute groups received in a request, but **MUST** reject a request
4258 that contains a supported operation attribute that contains an unsupported value.

4259 Conforming IPP objects **MAY** return operation responses that contain attributes groups, attributes names,
4260 attribute syntaxes, attribute values, and status codes that are extensions to this standard. The additional
4261 attribute groups **MAY** occur in any order. **Issue 26**

4262 The following section on object attributes specifies the support required for object attributes.

4263 5.2.3 IPP Object Attributes

4264 Conforming IPP objects **MUST** support all of the **REQUIRED** object attributes, as defined in this document
4265 in the indicated sections.

4266 If an object supports an attribute, it **MUST** support only those values specified in this document or through
4267 the extension mechanism described in section 5.2.4. It **MAY** support any non-empty subset of these values.
4268 That is, it **MUST** support at least one of the specified values and at most all of them.

4269 5.2.4 Versions

4270 Clients **MUST** meet the conformance requirements for clients specified in this document and [IPP-PRO]
4271 and **SHOULD** also support version 1.0, i.e., **SHOULD** meet the conformance requirements for clients as
4272 specified in [RFC2566] and [RFC2565].

4273 IPP Printer and Job objects **MUST** meet the conformance requirements for IPP objects specified in this
4274 document and [IPP-PRO]. For interoperability with IPP/1.0 clients, IPP/1.1 objects **SHOULD** also meet
4275 the conformance requirements for IPP objects as specified in [RFC2566] and [RFC2565].

4276 Clients **MUST** send requests containing a "version-number" parameter with a '1.1' value and **SHOULD** try
4277 supplying alternate version numbers if they receive a 'server-error-version-not-supported' error return in a
4278 response.

4279 IPP objects **MUST** accept requests containing a "version-number" parameter with a '1.1' value (or reject the
4280 request if the operation is not supported). IPP objects **SHOULD** accept any request with the major version
4281 '1' (or reject the request if the operation is not supported). See section 3.1.8. **ISSUE 36**

4282 5.2.5 Extensions

4283 A conforming IPP object MAY support registered extensions and private extensions, as long as they meet
4284 the requirements specified in Section 6.

4285 For each attribute included in an operation response, a conforming IPP object MUST return a value whose
4286 type and value syntax conforms to the requirement of the Model document as specified in Sections 3 and 4.

4287 5.2.6 Attribute Syntaxes

4288 An IPP object MUST be able to accept any of the attribute syntaxes defined in Section 4.1, including their
4289 full range, in any operation in which a client may supply attributes or the system administrator may
4290 configure attributes (by means outside the scope of this IPP/1.1 document). In particular for each attribute
4291 that the IPP object supports whose attribute syntax is 'text', the IPP object MUST accept and process both
4292 the 'textWithoutLanguage' and 'textWithLanguage' forms. Similarly, for each attribute that the IPP object
4293 supports whose attribute syntax is 'name', the IPP object MUST accept and process both the
4294 'nameWithoutLanguage' and 'nameWithLanguage' forms. Furthermore, an IPP object MUST return
4295 attributes to the client in operation responses that conform to the syntax specified in Section 4.1, including
4296 their full range if supplied previously by a client.

4297 5.2.7 Security **Issue 32**

4298 An IPP Printer implementation SHOULD contain support for Client Authentication as defined in the
4299 IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation MAY allow an
4300 administrator to configure the Printer so that all, some, or none of the users are authenticated. See also
4301 section 8 of this document.

4302 An IPP Printer implementation SHOULD contain support for Operation Privacy and Server Authentication
4303 as defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation MAY
4304 allow an administrator to configure the degree of support for Operation Privacy and Server Authentication.
4305 See also section 8 of this document.

4306 Security MUST NOT be compromised when a client supplies a lower "version-number" parameter in a
4307 request. For example, if an IPP/1.1 conforming Printer object accepts version '1.0' requests and is
4308 configured to enforce Digest Authentication, it MUST do the same for a version '1.0' request.

4309 5.3 Charset and Natural Language Requirements

4310 All clients and IPP objects MUST support the 'utf-8' charset as defined in section 4.1.7.

4311 IPP objects MUST be able to accept any client request which correctly uses the "attributes-natural-
4312 language" operation attribute or the Natural Language Override mechanism on any individual attribute
4313 whether or not the natural language is supported by the IPP object. If an IPP object supports a natural
4314 language, then it MUST be able to translate (perhaps by table lookup) all generated 'text' or 'name' attribute
4315 values into one of the supported languages (see section 3.1.4). That is, the IPP object that supports a

4316 natural language NEED NOT be a general purpose translator of any arbitrary 'text' or 'name' value supplied
4317 by the client into that natural language. However, the object MUST be able to translate (automatically
4318 generate) any of its own attribute values and messages into that natural language.

4319 6. IANA Considerations (registered and private extensions)

4320 This section describes how IPP can be extended to allow the following registered and private extensions to
4321 IPP:

- 4322 1. keyword attribute values
- 4323 2. enum attribute values
- 4324 3. attributes
- 4325 4. attribute syntaxes
- 4326 5. operations
- 4327 6. attribute groups
- 4328 7. status codes

4329

4330 Extensions registered for use with IPP/1.1 are OPTIONAL for client and IPP object conformance to the
4331 IPP/1.1 Model document.

4332 These extension procedures are aligned with the guidelines as set forth by the IESG [IANA-CON]. Section
4333 11 describes how to propose new registrations for consideration. IANA will reject registration proposals
4334 that leave out required information or do not follow the appropriate format described in Section 11. IPP/1.1
4335 may also be extended by an appropriate RFC that specifies any of the above extensions.

4336 6.1 Typed 'keyword' and 'enum' Extensions

4337 IPP allows for 'keyword' and 'enum' extensions (see sections 4.1.2.3 and 4.1.4). This document uses
4338 prefixes to the 'keyword' and 'enum' basic attribute syntax type in order to communicate extra information
4339 to the reader through its name. This extra information is not represented in the protocol because it is
4340 unimportant to a client or Printer object. The list below describes the prefixes and their meaning.

4341 "type1": This IPP specification document must be revised to add a new keyword or a new enum. No
4342 private keywords or enums are allowed.

4343

4344 "type2": Implementers can, at any time, add new keyword or enum values by proposing the complete
4345 specification to IANA:

4346

4347 iana@iana.org

4348

4349 IANA will forward the registration proposal to the IPP Designated Expert who will review the
4350 proposal with a mailing list that the Designated Expert keeps for this purpose. Initially, that list will
4351 be the mailing list used by the IPP WG:

4352

4353 ipp@pwg.org

4354

4355 even after the IPP WG is disbanded as permitted by [IANA-CON]. The IPP Designated Expert is
4356 appointed by the IESG Area Director responsible for IPP, according to [IANA-CON].

4357

4358 When a type2 keyword or enum is approved, the IPP Designated Expert becomes the point of
4359 contact for any future maintenance that might be required for that registration.

4360

4361 "type3": Implementers can, at any time, add new keyword and enum values by submitting the complete
4362 specification to IANA as for type2 who will forward the proposal to the IPP Designated Expert.
4363 While no additional technical review is required, the IPP Designated Expert may, at his/her
4364 discretion, forward the proposal to the same mailing list as for type2 registrations for advice and
4365 comment.

4366

4367 When a type3 keyword or enum is approved by the IPP Designated Expert, the original proposer
4368 becomes the point of contact for any future maintenance that might be required for that registration.

4369

4370 For type2 and type3 keywords, the proposer includes the name of the keyword in the registration proposal
4371 and the name is part of the technical review.

4372 After type2 and type3 enums specifications are approved, the IPP Designated Expert in consultation with
4373 IANA assigns the next available enum number for each enum value.

4374 IANA will publish approved type2 and type3 keyword and enum attributes value registration specifications
4375 in:

4376 ftp.isi.edu/iana/assignments/ipp/attribute-values/xxx/yyy.txt

4377 where xxx is the attribute name that specifies the initial values and yyy.txt is a descriptive file name that
4378 contains one or more enums or keywords approved at the same time. For example, if several additional
4379 enums for stapling are approved for use with the "finishings" attribute (and "finishings-default" and
4380 "finishings-supported" attributes), IANA will publish the additional values in the file:

4381 ftp.isi.edu/iana/assignments/ipp/attribute-values/finishings/stapling.txt

4382 Note: Some attributes are defined to be: 'type3 keywords' | 'name' which allows for attribute values to be
4383 extended by a site administrator with administrator defined names. Such names are not registered with
4384 IANA.

4385 By definition, each of the three types above assert some sort of registry or review process in order for
4386 extensions to be considered valid. Each higher numbered level (1, 2, 3) tends to be decreasingly less
4387 stringent than the previous level. Therefore, any typeN value MAY be registered using a process for some
4388 typeM where M is less than N, however such registration is NOT REQUIRED. For example, a type3 value
4389 MAY be registered in a type 1 manner (by being included in a future version of an IPP specification),
4390 however, it is NOT REQUIRED.

4391 This document defines keyword and enum values for all of the above types, including type3 keywords.

4392 For private (unregistered) keyword extensions, implementers SHOULD use keywords with a suitable
4393 distinguishing prefix, such as "xxx-" where xxx is the (lowercase) fully qualified company name registered
4394 with IANA for use in domain names [RFC1035]. For example, if the company XYZ Corp. had obtained
4395 the domain name "XYZ.com", then a private keyword 'abc' would be: 'xyz.com-abc'.

4396 Note: RFC 1035 [RFC1035] indicates that while upper and lower case letters are allowed in domain names,
4397 no significance is attached to the case. That is, two names with the same spelling but different case are to
4398 be treated as if identical. Also, the labels in a domain name must follow the rules for ARPANET host
4399 names: They must start with a letter, end with a letter or digit, and have as interior characters only letters,
4400 digits, and hyphen. Labels must be 63 characters or less. Labels are separated by the "." character.

4401 For private (unregistered) enum extension, implementers MUST use values in the reserved integer range
4402 which is 2**30 to 2**31-1.

4403 6.2 Attribute Extensibility

4404 Attribute names are type2 keywords. Therefore, new attributes may be registered and have the same status
4405 as attributes in this document by following the type2 extension rules. For private (unregistered) attribute
4406 extensions, implementers SHOULD use keywords with a suitable distinguishing prefix as described in
4407 Section 6.1.

4408 IANA will publish approved attribute registration specifications as separate files:

4409 `ftp.isi.edu/iana/assignments/ipp/attributes/xxx-yyy.txt`

4410 where "xxx-yyy" is the new attribute name.

4411 If a new Printer object attribute is defined and its values can be affected by a specific document format, its
4412 specification needs to contain the following sentence:

4413 "The value of this attribute returned in a Get-Printer-Attributes response MAY depend on the
4414 "document-format" attribute supplied (see Section 3.2.5.1)."

4415 If the specification does not, then its value in the Get-Printer-Attributes response MUST NOT depend on
4416 the "document-format" supplied in the request. When a new Job Template attribute is registered, the value
4417 of the Printer attributes MAY vary with "document-format" supplied in the request without the
4418 specification having to indicate so.

4419 6.3 Attribute Syntax Extensibility

4420 Attribute syntaxes are like type2 enums. Therefore, new attribute syntaxes may be registered and have the
4421 same status as attribute syntaxes in this document by following the type2 extension rules described in
4422 Section 6.1. The value codes that identify each of the attribute syntaxes are assigned in the "Encoding and
4423 Transport" document [IPP-PRO], including a designated range for private, experimental use.

4424 For attribute syntaxes, the IPP Designated Expert in consultation with IANA assigns the next attribute
4425 syntax code in the appropriate range as specified in [IPP-PRO]. IANA will publish approved attribute
4426 syntax registration specifications as separate files:

4427 `ftp.isi.edu/iana/assignments/ipp/attribute-syntaxes/xxx-yyy.txt`

4428 where 'xxx-yyy' is the new attribute syntax name.

4429 6.4 Operation Extensibility

4430 Operations may also be registered following the type2 procedures described in Section 6.1, though major
4431 new operations will usually be done by a new standards track RFC that augments this document. For
4432 private (unregistered) operation extensions, implementers MUST use the range for the "operation-id" in
4433 requests specified in Section 4.4.15 "operations-supported" Printer attribute.

4434 For operations, the IPP Designated Expert in consultation with IANA assigns the next operation-id code as
4435 specified in Section 4.4.15. IANA will publish approved operation registration specifications as separate
4436 files:

4437 `ftp.isi.edu/iana/assignments/ipp/operations/Xxx-Yyy.txt`

4438 where "Xxx-Yyy" is the new operation name.

4439 6.5 Attribute Groups

4440 Attribute groups passed in requests and responses may be registered following the type2 procedures
4441 described in Section 6.1. The tags that identify each of the attribute groups are assigned in [IPP-PRO].

4442 For attribute groups, the IPP Designated Expert in consultation with IANA assigns the next attribute group
4443 tag code in the appropriate range as specified in [IPP-PRO]. IANA will publish approved attribute group
4444 registration specifications as separate files:

4445 `ftp.isi.edu/iana/assignments/ipp/attribute-group-tags/xxx-yyy-tag.txt`

4446 where 'xxx-yyy-tag' is the new attribute group tag name.

4447 6.6 Status Code Extensibility

4448 Operation status codes may also be registered following the type2 procedures described in Section 6.1. The
4449 values for status codes are allocated in ranges as specified in Section 14 for each status code class:

- 4450 "informational" - Request received, continuing process
- 4451 "successful" - The action was successfully received, understood, and accepted
- 4452 "redirection" - Further action must be taken in order to complete the request
- 4453 "client-error" - The request contains bad syntax or cannot be fulfilled
- 4454 "server-error" - The IPP object failed to fulfill an apparently valid request

4455

4456 For private (unregistered) operation status code extensions, implementers **MUST** use the top of each range
4457 as specified in Section 13.

4458 For operation status codes, the IPP Designated Expert in consultation with IANA assigns the next status
4459 code in the appropriate class range as specified in Section 13. IANA will publish approved status code
4460 registration specifications as separate files:

4461 `ftp.isi.edu/iana/assignments/ipp/status-codes/xxx-yyy.txt`

4462 where "xxx-yyy" is the new operation status code keyword.

4463 6.7 Registration of MIME types/sub-types for document-formats

4464 The "document-format" attribute's syntax is 'mimeMediaType'. This means that valid values are Internet
4465 Media Types (see Section 4.1.9). RFC 2045 [RFC2045] defines the syntax for valid Internet media types.
4466 IANA is the registry for all Internet media types.

4467 6.8 Registration of charsets for use in 'charset' attribute values

4468 The "attributes-charset" attribute's syntax is 'charset'. This means that valid values are charsets names.
4469 When a charset in the IANA registry has more than one name (alias), the name labeled as "(preferred
4470 MIME name)", if present, **MUST** be used (see Section 4.1.7). IANA is the registry for charsets following
4471 the procedures of [RFC2278].

4472 7. Internationalization Considerations

4473 Some of the attributes have values that are text strings and names which are intended for human
4474 understanding rather than machine understanding (see the 'text' and 'name' attribute syntaxes in Sections
4475 4.1.1 and 4.1.2).

4476 In each operation request, the client

- 4477 - identifies the charset and natural language of the request which affects each supplied 'text' and 'name'
4478 attribute value, and

4479 - requests the charset and natural language for attributes returned by the IPP object in operation
4480 responses (as described in Section 3.1.4.1).
4481

4482 In addition, the client MAY separately and individually identify the Natural Language Override of a
4483 supplied 'text' or 'name' attribute using the 'textWithLanguage' and 'nameWithLanguage' technique
4484 described section 4.1.1.2 and 4.1.2.2 respectively.

4485 All IPP objects MUST support the UTF-8 [RFC2279] charset in all 'text' and 'name' attributes supported. If
4486 an IPP object supports more than the UTF-8 charset, the object MUST convert between them in order to
4487 return the requested charset to the client according to Section 3.1.4.2. If an IPP object supports more than
4488 one natural language, the object SHOULD return 'text' and 'name' values in the natural language requested
4489 where those values are generated by the Printer (see Section 3.1.4.1).

4490 For Printers that support multiple charsets and/or multiple natural languages in 'text' and 'name' attributes,
4491 different jobs may have been submitted in differing charsets and/or natural languages. All responses MUST
4492 be returned in the charset requested by the client. However, the Get-Jobs operation uses the
4493 'textWithLanguage' and 'nameWithLanguage' mechanism to identify the differing natural languages with
4494 each job attribute returned.

4495 The Printer object also has configured charset and natural language attributes. The client can query the
4496 Printer object to determine the list of charsets and natural languages supported by the Printer object and
4497 what the Printer object's configured values are. See the "charset-configured", "charset-supported", "natural-
4498 language-configured", and "generated-natural-language-supported" Printer description attributes for more
4499 details.

4500 The "charset-supported" attribute identifies the supported charsets. If a charset is supported, the IPP
4501 object MUST be capable of converting to and from that charset into any other supported charset. In many
4502 cases, an IPP object will support only one charset and it MUST be the UTF-8 charset.

4503 The "charset-configured" attribute identifies the one supported charset which is the native charset given the
4504 current configuration of the IPP object (administrator defined).

4505 The "generated-natural-language-supported" attribute identifies the set of supported natural languages for
4506 generated messages; it is not related to the set of natural languages that must be accepted for client supplied
4507 'text' and 'name' attributes. For client supplied 'text' and 'name' attributes, an IPP object MUST accept ALL
4508 supplied natural languages. Just because a Printer object is currently configured to support 'en-us' natural
4509 language does not mean that the Printer object should reject a job if the client supplies a job name that is in
4510 'fr-ca'.

4511 The "natural-language-configured" attribute identifies the one supported natural language for generated
4512 messages which is the native natural language given the current configuration of the IPP object
4513 (administrator defined).

4514 Attributes of type 'text' and 'name' are populated from different sources. These attributes can be categorized
4515 into following groups (depending on the source of the attribute):

- 4516 1. Some attributes are supplied by the client (e.g., the client supplied "job-name", "document-name",
 4517 and "requesting-user-name" operation attributes along with the corresponding Job object's "job-
 4518 name" and "job-originating-user-name" attributes). The IPP object MUST accept these attributes in
 4519 any natural language no matter what the set of supported languages for generated messages
- 4520 2. Some attributes are supplied by the system administrator (e.g., the Printer object's "printer-name" and
 4521 "printer-location" attributes). These too can be in any natural language. If the natural language for
 4522 these attributes is different than what a client requests, then they must be reported using the Natural
 4523 Language Override mechanism.
- 4524 3. Some attributes are supplied by the device manufacturer (e.g., the Printer object's "printer-make-and-
 4525 model" attribute). These too can be in any natural language. If the natural language for these
 4526 attributes is different than what a client requests, then they must be reported using the Natural
 4527 Language Override mechanism.
- 4528 4. Some attributes are supplied by the operator (e.g., the Job object's "job-message-from-operator"
 4529 attribute). These too can be in any natural language. If the natural language for these attributes is
 4530 different than what a client requests, then they must be reported using the Natural Language
 4531 Override mechanism.
- 4532 5. Some attributes are generated by the IPP object (e.g., the Job object's "job-state-message" attribute,
 4533 the Printer object's "printer-state-message" attribute, and the "status-message" operation attribute).
 4534 These attributes can only be in one of the "generated-natural-language-supported" natural
 4535 languages. If a client requests some natural language for these attributes other than one of the
 4536 supported values, the IPP object SHOULD respond using the value of the "natural-language-
 4537 configured" attribute (using the Natural Language Override mechanism if needed).
 4538

4539 The 'text' and 'name' attributes specified in this version of this document (additional ones will be registered
 4540 according to the procedures in Section 6) are:

Attributes	Source
Operation Attributes:	
job-name (name)	client
document-name (name)	client
requesting-user-name (name)	client
status-message	Job or Printer object
Job Template Attributes:	
job-hold-until (keyword name)	client matches administrator-configured
job-hold-until-default (keyword name)	client matches administrator-configured
job-hold-until-supported (keyword name)	client matches administrator-configured
job-sheets (keyword name)	client matches administrator-configured
job-sheets-default (keyword name)	client matches administrator-configured
job-sheets-supported (keyword name)	client matches administrator-configured
media (keyword name)	client matches administrator-configured
media-default (keyword name)	client matches administrator-configured
media-supported (keyword name)	client matches administrator-configured
media-ready (keyword name)	client matches administrator-configured

Job Description Attributes:		
	job-name (name)	client or Printer object
	job-originating-user-name (name)	Printer object
	job-state-message (text)	Job or Printer object
	output-device-assigned (name(127))	administrator
	job-message-from-operator (text(127))	operator
Printer Description Attributes:		
	printer-name (name(127))	administrator
	printer-location (text(127))	administrator
	printer-info (text(127))	administrator
	printer-make-and-model (text(127))	administrator or manufacturer
	printer-state-message (text)	Printer object
	printer-message-from-operator (text(127))	operator

4541 8. Security Considerations

4542 It is difficult to anticipate the security risks that might exist in any given IPP environment. For example, if
 4543 IPP is used within a given corporation over a private network, the risks of exposing document data may be
 4544 low enough that the corporation will choose not to use encryption on that data. However, if the connection
 4545 between the client and the IPP object is over a public network, the client may wish to protect the content of
 4546 the information during transmission through the network with encryption.

4547 Furthermore, the value of the information being printed may vary from one IPP environment to the next.
 4548 Printing payroll checks, for example, would have a different value than printing public information from a
 4549 file. There is also the possibility of denial-of-service attacks, but denial-of-service attacks against printing
 4550 resources are not well understood and there is no published precedents regarding this scenario.

4551 Once the authenticated identity of the requester has been supplied to the IPP object, the object uses that
 4552 identity to enforce any authorization policy that might be in place. For example, one site's policy might be
 4553 that only the job owner is allowed to cancel a job. The details and mechanisms to set up a particular access
 4554 control policy are not part of IPP/1.1, and must be established via some other type of administrative or
 4555 access control framework. However, there are operation status codes that allow an IPP server to return
 4556 information back to a client about any potential access control violations for an IPP object.

4557 During a create operation, the client's identity is recorded in the Job object in an implementation-defined
 4558 attribute. This information can be used to verify a client's identity for subsequent operations on that Job
 4559 object in order to enforce any access control policy that might be in effect. See section 8.3 below for more
 4560 details.

4561 Since the security levels or the specific threats that any given IPP system administrator may be concerned
 4562 with cannot be anticipated, IPP MUST be capable of operating with different security mechanisms and

4563 security policies as required by the individual installation. Security policies might vary from very strong, to
4564 very weak, to none at all, and corresponding security mechanisms will be required.

4565 8.1 Security Scenarios

4566 The following sections describe specific security attacks for IPP environments. Where examples are
4567 provided they should be considered illustrative of the environment and not an exhaustive set. Not all of
4568 these environments will necessarily be addressed in initial implementations of IPP.

4569 8.1.1 Client and Server in the Same Security Domain

4570 This environment is typical of internal networks where traditional office workers print the output of
4571 personal productivity applications on shared work-group printers, or where batch applications print their
4572 output on large production printers. Although the identity of the user may be trusted in this environment, a
4573 user might want to protect the content of a document against such attacks as eavesdropping, replaying or
4574 tampering.

4575 8.1.2 Client and Server in Different Security Domains

4576 Examples of this environment include printing a document created by the client on a publicly available
4577 printer, such as at a commercial print shop; or printing a document remotely on a business associate's
4578 printer. This latter operation is functionally equivalent to sending the document to the business associate as
4579 a facsimile. Printing sensitive information on a Printer in a different security domain requires strong
4580 security measures. In this environment authentication of the printer is required as well as protection against
4581 unauthorized use of print resources. Since the document crosses security domains, protection against
4582 eavesdropping and document tampering are also required. It will also be important in this environment to
4583 protect Printers against "spamming" and malicious document content.

4584 8.1.3 Print by Reference

4585 When the document is not stored on the client, printing can be done by reference. That is, the print request
4586 can contain a reference, or pointer, to the document instead of the actual document itself (see sections 3.2.2
4587 and 3.3.2). Standard methods currently do not exist for remote entities to "assume" the credentials of a
4588 client for forwarding requests to a 3rd party. It is anticipated that Print-By-Reference will be used to access
4589 "public" documents and that sophisticated methods for authenticating "proxies" is not specified in this
4590 document.

4591 8.2 URIs in Operation, Job, and Printer attributes

4592 The "printer-uri-supported" attribute contains the Printer object's URI(s). Its companion attribute, "uri-
4593 security-supported", identifies the security mechanism used for each URI listed in the "printer-uri-
4594 supported" attribute. For each Printer operation request, a client MUST supply only one URI in the
4595 "printer-uri" operation attribute. In other words, even though the Printer supports more than one URI, the
4596 client only interacts with the Printer object using one of its URIs. This duality is not needed for Job objects,

4597 since the Printer object is the factory for Job objects, and the Printer object will generate the correct URI
4598 for new Job objects depending on the Printer object's security configuration.

4599 8.3 URIs for each authentication mechanisms

4600 Each URI has an authentication mechanism associated with it. If the URI is the *i*'th element of "printer-uri-
4601 supported", then authentication mechanism is the "*i* th" element of "uri-authentication-supported". For a list
4602 of possible authentication mechanisms, see section 4.4.2.

4603 The Printer object uses an authentication mechanism to determine the name of the user performing an
4604 operation. This user is called the "authenticated user". The credibility of authentication depends on the
4605 mechanism that the Printer uses to obtain the user's name. When the authentication mechanism is 'none', all
4606 authenticated users are "anonymous".

4607 During job creation operations, the Printer initializes the value of the "job-originating-user-name" attribute
4608 (see section 4.3.6) to be the authenticated user. The authenticated user in this case is called the "job-owner".

4609 If an implementation can be configured to support more than one authentication mechanism, then it **MUST**
4610 implement rules for determining equality of authenticated user names which have been authenticated via
4611 different authentication mechanisms. One possible policy is that identical names that are authenticated via
4612 different mechanism are different. For example, a user can cancel his job only if he uses the same
4613 authentication mechanism for both Cancel-Job and Print-Job. Another policy is that identical names that
4614 are authenticated via different mechanism are the same if the authentication mechanism for the later
4615 operation is not less strong than the authentication mechanism for the earlier job creation operation. For
4616 example, a user can cancel his job only if he uses the same or stronger authentication mechanism for
4617 Cancel-Job and Print-Job. With this second policy a job submitted via 'requesting-user-name' authentication
4618 could be cancelled via 'digest' authentication. With the first policy, the job could not be cancelled in this
4619 way.

4620 A client is able to determine the authentication mechanism used to create a job. It is the *i*'th value of the
4621 Printer's "uri-authentication-supported" attribute (see section 4.4.2), where *i* is the index of the element of
4622 the Printer's "printer-uri-supported" attribute (see section 4.4.1) equal to the job's "job-printer-uri" attribute
4623 (see section 4.3.3).

4624

4625

4626 8.4 Restricted Queries

4627 In many IPP operations, a client supplies a list of attributes to be returned in the response. For security
4628 reasons, an IPP object may be configured not to return all attributes (or all values) that a client requests.
4629 The job attributes returned **MAY** depend on whether the requesting user is the same as the user that
4630 submitted the job. The IPP object **MAY** even return none of the requested attributes. In such cases, the

4631 status returned is the same as if the object had returned all requested attributes. The client cannot tell by
4632 such a response whether the requested attribute was present or absent on the object.

4633 8.5 Operations performed by operators and system administrators

4634 For the three printer operations Pause-Printer, Resume-Printer, and Purge-Jobs (see sections 3.2.7, 3.2.8 and
4635 3.2.9), the requesting user is intended to be an operator or administrator of the Printer object (see section 1).
4636 For operations on jobs, the requesting user is intended to be the job owner or may be an operator or
4637 administrator of the Printer object. The means for authorizing an operator or administrator of the Printer
4638 object are not specified in this document.

4639 8.6 Queries on jobs submitted using non-IPP protocols

4640 If the device that an IPP Printer is representing is able to accept jobs using other job submission protocols
4641 in addition to IPP, it is RECOMMENDED that such an implementation at least allow such "foreign" jobs to
4642 be queried using Get-Jobs returning "job-id" and "job-uri" as 'unknown'. Such an implementation NEED
4643 NOT support all of the same IPP job attributes as for IPP jobs. The IPP object returns the 'unknown' out-of-
4644 band value for any requested attribute of a foreign job that is supported for IPP jobs, but not for foreign
4645 jobs.

4646 It is further RECOMMENDED, that the IPP Printer generate "job-id" and "job-uri" values for such "foreign
4647 jobs", if possible, so that they may be targets of other IPP operations, such as Get-Job-Attributes and
4648 Cancel-Job. Such an implementation also needs to deal with the problem of authentication of such foreign
4649 jobs. One approach would be to treat all such foreign jobs as belonging to users other than the user of the
4650 IPP client. Another approach would be for the foreign job to belong to 'anonymous'. Only if the IPP client
4651 has been authenticated as an operator or administrator of the IPP Printer object, could the foreign jobs be
4652 queried by an IPP request. Alternatively, if the security policy is to allow users to query other users' jobs,
4653 then the foreign jobs would also be visible to an end-user IPP client using Get-Jobs and Get-Job-Attributes.

4870 11. Formats for IPP Registration Proposals

4871 In order to propose an IPP extension for registration, the proposer must submit an application to IANA by
4872 email to "iana@iana.org" or by filling out the appropriate form on the IANA web pages
4873 (<http://www.iana.org>). This section specifies the required information and the formats for proposing
4874 registrations of extensions to IPP as provided in Section 6 for:

4875

- 4876 1. type2 'keyword' attribute values
- 4877 2. type3 'keyword' attribute values
- 4878 3. type2 'enum' attribute values
- 4879 4. type3 'enum' attribute values
- 4880 5. attributes
- 4881 6. attribute syntaxes
- 4882 7. operations
- 4883 8. status codes

4884 11.1 Type2 keyword attribute values registration

4885 Type of registration: type2 keyword attribute value
4886 Name of attribute to which this keyword specification is to be added:
4887 Proposed keyword name of this keyword value:
4888 Specification of this keyword value (follow the style of IPP Model Section 4.1.2.3):
4889 Name of proposer:
4890 Address of proposer:
4891 Email address of proposer:

4892

4893 Note: For type2 keywords, the Designated Expert will be the point of contact for the approved registration
4894 specification, if any maintenance of the registration specification is needed.

4895 11.2 Type3 keyword attribute values registration

4896 Type of registration: type3 keyword attribute value
4897 Name of attribute to which this keyword specification is to be added:
4898 Proposed keyword name of this keyword value:
4899 Specification of this keyword value (follow the style of IPP Model Section 4.1.2.3):
4900 Name of proposer:
4901 Address of proposer:
4902 Email address of proposer:

4903

4904 Note: For type3 keywords, the proposer will be the point of contact for the approved registration
4905 specification, if any maintenance of the registration specification is needed.

4906 11.3 Type2 enum attribute values registration

4907 Type of registration: type2 enum attribute value
4908 Name of attribute to which this enum specification is to be added:

4909 Keyword symbolic name of this enum value:
4910 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):
4911 Specification of this enum value (follow the style of IPP Model Section 4.1.4):
4912 Name of proposer:
4913 Address of proposer:
4914 Email address of proposer:
4915
4916 Note: For type2 enums, the Designated Expert will be the point of contact for the approved registration
4917 specification, if any maintenance of the registration specification is needed.

4918 11.4 Type3 enum attribute values registration

4919 Type of registration: type3 enum attribute value
4920 Name of attribute to which this enum specification is to be added:
4921 Keyword symbolic name of this enum value:
4922 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):
4923 Specification of this enum value (follow the style of IPP Model Section 4.1.4):
4924 Name of proposer:
4925 Address of proposer:
4926 Email address of proposer:
4927
4928 Note: For type3 enums, the proposer will be the point of contact for the approved registration specification,
4929 if any maintenance of the registration specification is needed.

4930 11.5 Attribute registration

4931 Type of registration: attribute
4932 Proposed keyword name of this attribute:
4933 Types of attribute (Operation, Job Template, Job Description, Printer Description):
4934 Operations to be used with if the attribute is an operation attribute:
4935 Object (Job, Printer, etc. if bound to an object):
4936 Attribute syntax(es) (include 1setOf and range as in Section 4.2):
4937 If attribute syntax is 'keyword' or 'enum', is it type2 or type3:
4938 If this is a Printer attribute, MAY the value returned depend on "document-format" (See Section 6.2):
4939 If this is a Job Template attribute, how does its specification depend on the value of the "multiple-
4940 document-handling" attribute:
4941 Specification of this attribute (follow the style of IPP Model Section 4.2):
4942 Name of proposer:
4943 Address of proposer:
4944 Email address of proposer:
4945
4946 Note: For attributes, the IPP Designated Expert will be the point of contact for the approved registration
4947 specification, if any maintenance of the registration specification is needed.

4948 11.6 Attribute Syntax registration

4949 Type of registration: attribute syntax

4950 Proposed name of this attribute syntax:

4951 Type of attribute syntax (integer, octetString, character-string, see [IPP-PRO]):

4952 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):

4953 Specification of this attribute (follow the style of IPP Model Section 4.1):

4954 Name of proposer:

4955 Address of proposer:

4956 Email address of proposer:

4957

4958 Note: For attribute syntaxes, the IPP Designated Expert will be the point of contact for the approved
4959 registration specification, if any maintenance of the registration specification is needed.

4960 11.7 Operation registration

4961 Type of registration: operation

4962 Proposed name of this operation:

4963 Numeric operation-id value (to be assigned by the IPP Designated Expert in consultation with IANA):

4964 Object Target (Job, Printer, etc. that operation is upon):

4965 Specification of this attribute (follow the style of IPP Model Section 3):

4966 Name of proposer:

4967 Address of proposer:

4968 Email address of proposer:

4969

4970 Note: For operations, the IPP Designated Expert will be the point of contact for the approved registration
4971 specification, if any maintenance of the registration specification is needed.

4972 11.8 Attribute Group registration

4973 Type of registration: attribute group

4974 Proposed name of this attribute group:

4975 Numeric tag according to [IPP-PRO] (to be assigned by the IPP Designated Expert in consultation with
4976 IANA):

4977 Operation requests and group number for each operation in which the attribute group occurs:

4978 Operation responses and group number for each operation in which the attribute group occurs:

4979 Specification of this attribute group (follow the style of IPP Model Section 3):

4980 Name of proposer:

4981 Address of proposer:

4982 Email address of proposer:

4983

4984 Note: For attribute groups, the IPP Designated Expert will be the point of contact for the approved
4985 registration specification, if any maintenance of the registration specification is needed.

4986 11.9 Status code registration

4987 Type of registration: status code

4988 Keyword symbolic name of this status code value:

4989 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):

4990 Operations that this status code may be used with:

4991 Specification of this status code (follow the style of IPP Model Section 13 APPENDIX B: Status Codes
4992 and Suggested Status Code Messages):

4993 Name of proposer:

4994 Address of proposer:

4995 Email address of proposer:

4996

4997 Note: For status codes, the Designated Expert will be the point of contact for the approved registration
4998 specification, if any maintenance of the registration specification is needed.

4999 12. APPENDIX A: Terminology

5000 This specification document uses the terminology defined in this section.

5001 12.1 Conformance Terminology

5002 The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT",
5003 "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in
5004 RFC 2119 [RFC2119].

5005 12.1.1 NEED NOT

5006 This term is not included in RFC 2119. The verb "NEED NOT" indicates an action that the subject of the
5007 sentence does not have to implement in order to claim conformance to the standard. The verb "NEED
5008 NOT" is used instead of "MAY NOT" since "MAY NOT" sounds like a prohibition.

5009 12.2 Model Terminology

5010 12.2.1 Keyword

5011 Keywords are used within this document as identifiers of semantic entities within the abstract model (see
5012 section 4.1.2.3). Attribute names, some attribute values, attribute syntaxes, and attribute group names are
5013 represented as keywords.

5014 12.2.2 Attributes

5015 An attribute is an item of information that is associated with an instance of an IPP object. An attribute
5016 consists of an attribute name and one or more attribute values. Each attribute has a specific attribute syntax.
5017 All object attributes are defined in section 4 and all operation attributes are defined in section 3.

5018 Job Template Attributes are described in section 4.2. The client optionally supplies Job Template attributes
5019 in a create request (operation requests that create Job objects). The Printer object has associated attributes
5020 which define supported and default values for the Printer.

5021 12.2.2.1 Attribute Name

5022 Each attribute is uniquely identified in this document by its attribute name. An attribute name is a keyword.
5023 The keyword attribute name is given in the section header describing that attribute. In running text in this
5024 document, attribute names are indicated inside double quotation marks (") where the quotation marks are
5025 not part of the keyword itself.

5026 12.2.2.2 Attribute Group Name

5027 Related attributes are grouped into named groups. The name of the group is a keyword. The group name
5028 may be used in place of naming all the attributes in the group explicitly. Attribute groups are defined in
5029 section 3.

5030 12.2.2.3 Attribute Value

5031 Each attribute has one or more values. Attribute values are represented in the syntax type specified for that
5032 attribute. In running text in this document, attribute values are indicated inside single quotation marks ('),
5033 whether their attribute syntax is keyword, integer, text, etc. where the quotation marks are not part of the
5034 value itself.

5035 12.2.2.4 Attribute Syntax

5036 Each attribute is defined using an explicit syntax type. In this document, each syntax type is defined as a
5037 keyword with specific meaning. The "Encoding and Transport" document [IPP-PRO] indicates the actual
5038 "on-the-wire" encoding rules for each syntax type. Attribute syntax types are defined in section 4.1.

5039 12.2.3 Supports

5040 By definition, a Printer object supports an attribute only if that Printer object responds with the
5041 corresponding attribute populated with some value(s) in a response to a query for that attribute. A Printer
5042 object supports an attribute value if the value is one of the Printer object's "supported values" attributes.
5043 The device behind a Printer object may exhibit a behavior that corresponds to some IPP attribute, but if the
5044 Printer object, when queried for that attribute, doesn't respond with the attribute, then as far as IPP is
5045 concerned, that implementation does not support that feature. If the Printer object's "xxx-supported"

5046 attribute is not populated with a particular value (even if that value is a legal value for that attribute), then
5047 that Printer object does not support that particular value.

5048 A conforming implementation **MUST** support all **REQUIRED** attributes. However, even for **REQUIRED**
5049 attributes, conformance to IPP does not mandate that all implementations support all possible values
5050 representing all possible job processing behaviors and features. For example, if a given instance of a
5051 Printer supports only certain document formats, then that Printer responds with the "document-format-
5052 supported" attribute populated with a set of values, possibly only one, taken from the entire set of possible
5053 values defined for that attribute. This limited set of values represents the Printer's set of supported
5054 document formats. Supporting an attribute and some set of values for that attribute enables IPP end users to
5055 be aware of and make use of those features associated with that attribute and those values. If an
5056 implementation chooses to not support an attribute or some specific value, then IPP end users would have
5057 no ability to make use of that feature within the context of IPP itself. However, due to existing practice and
5058 legacy systems which are not IPP aware, there might be some other mechanism outside the scope of IPP to
5059 control or request the "unsupported" feature (such as embedded instructions within the document data
5060 itself).

5061 For example, consider the "finishings-supported" attribute.

- 5062 1) If a Printer object is not physically capable of stapling, the "finishings-supported" attribute **MUST**
5063 NOT be populated with the value of 'staple'.
- 5064 2) A Printer object is physically capable of stapling, however an implementation chooses not to support
5065 stapling in the IPP "finishings" attribute. In this case, 'staple' **MUST NOT** be a value in the
5066 "finishings-supported" Printer object attribute. Without support for the value 'staple', an IPP end
5067 user would have no means within the protocol itself to request that a Job be stapled. However, an
5068 existing document data formatter might be able to request that the document be stapled directly with
5069 an embedded instruction within the document data. In this case, the IPP implementation does not
5070 "support" stapling, however the end user is still able to have some control over the stapling of the
5071 completed job.
- 5072 3) A Printer object is physically capable of stapling, and an implementation chooses to support stapling
5073 in the IPP "finishings" attribute. In this case, 'staple' **MUST** be a value in the "finishings-supported"
5074 Printer object attribute. Doing so, would enable end users to be aware of and make use of the
5075 stapling feature using IPP attributes.

5076

5077 Even though support for Job Template attributes by a Printer object is **OPTIONAL**, it is **RECOMMENDED**
5078 that if the device behind a Printer object is capable of realizing any feature or function that corresponds to
5079 an IPP attribute and some associated value, then that implementation **SHOULD** support that IPP attribute
5080 and value.

5081 The set of values in any of the supported value attributes is set (populated) by some administrative process
5082 or automatic sensing mechanism that is outside the scope of this IPP/1.1 document. For administrative
5083 policy and control reasons, an administrator may choose to make only a subset of possible values visible to
5084 the end user. In this case, the real output device behind the IPP Printer abstraction may be capable of a
5085 certain feature, however an administrator is specifying that access to that feature not be exposed to the end
5086 user through the IPP protocol. Also, since a Printer object may represent a logical print device (not just a
5087 physical device) the actual process for supporting a value is undefined and left up to the implementation.

5088 However, if a Printer object supports a value, some manual human action may be needed to realize the
5089 semantic action associated with the value, but no end user action is required.

5090 For example, if one of the values in the "finishings-supported" attribute is 'staple', the actual process might
5091 be an automatic staple action by a physical device controlled by some command sent to the device. Or, the
5092 actual process of stapling might be a manual action by an operator at an operator attended Printer object.

5093 For another example of how supported attributes function, consider a system administrator who desires to
5094 control all print jobs so that no job sheets are printed in order to conserve paper. To force no job sheets, the
5095 system administrator sets the only supported value for the "job-sheets-supported" attribute to 'none'. In this
5096 case, if a client requests anything except 'none', the create request is rejected or the "job-sheets" value is
5097 ignored (depending on the value of "ipp-attribute-fidelity"). To force the use of job start/end sheets on all
5098 jobs, the administrator does not include the value 'none' in the "job-sheets-supported" attribute. In this case,
5099 if a client requests 'none', the create request is rejected or the "job-sheets" value is ignored (again depending
5100 on the value of "ipp-attribute-fidelity").

5101 12.2.4 print-stream page

5102 A "print-stream page" is a page according to the definition of pages in the language used to express the
5103 document data.

5104 12.2.5 impression

5105 An "impression" is the image (possibly many print-stream pages in different configurations) imposed onto a
5106 single media page.

5107 13. APPENDIX B: Status Codes and Suggested Status Code Messages

5108 This section defines status code enum keywords and values that are used to provide semantic information
5109 on the results of an operation request. Each operation response **MUST** include a status code. The response
5110 **MAY** also contain a status message that provides a short textual description of the status. The status code
5111 is intended for use by automata, and the status message is intended for the human end user. Since the status
5112 message is an **OPTIONAL** component of the operation response, an IPP application (i.e., a browser, GUI,
5113 print driver or gateway) is **NOT REQUIRED** to examine or display the status message, since it **MAY** not be
5114 returned to the application.

5115 The prefix of the status keyword defines the class of response as follows:

- 5116 "informational" - Request received, continuing process
- 5117 "successful" - The action was successfully received, understood, and accepted
- 5118 "redirection" - Further action must be taken in order to complete the request
- 5119 "client-error" - The request contains bad syntax or cannot be fulfilled
- 5120 "server-error" - The IPP object failed to fulfill an apparently valid request

5121

5122 As with type2 enums, IPP status codes are extensible. IPP clients are NOT REQUIRED to understand the
5123 meaning of all registered status codes, though such understanding is obviously desirable. However, IPP
5124 clients MUST understand the class of any status code, as indicated by the prefix, and treat any unrecognized
5125 response as being equivalent to the first status code of that class, with the exception that an unrecognized
5126 response MUST NOT be cached. For example, if an unrecognized status code of "client-error-xxx-yyy" is
5127 received by the client, it can safely assume that there was something wrong with its request and treat the
5128 response as if it had received a "client-error-bad-request" status code. In such cases, IPP applications
5129 SHOULD present the OPTIONAL message (if present) to the end user since the message is likely to
5130 contain human readable information which will help to explain the unusual status. The name of the enum
5131 is the suggested status message for US English.

5132 The status code values range from 0x0000 to 0x7FFF. The value ranges for each status code class are as
5133 follows:

5134 "successful" - 0x0000 to 0x00FF
5135 "informational" - 0x0100 to 0x01FF
5136 "redirection" - 0x0200 to 0x02FF
5137 "client-error" - 0x0400 to 0x04FF
5138 "server-error" - 0x0500 to 0x05FF
5139

5140 The top half (128 values) of each range (0x0n40 to 0x0nFF, for n = 0 to 5) is reserved for private use within
5141 each status code class. Values 0x0600 to 0x7FFF are reserved for future assignment and MUST NOT be
5142 used.

5143 13.1 Status Codes

5144 Each status code is described below. Section 13.1.5.9 contains a table that indicates which status codes
5145 apply to which operations. The Implementer's Guide [IPP-IIG] describe the suggested steps for processing
5146 IPP attributes for all operations, including returning status codes.

5147 13.1.1 Informational

5148 This class of status code indicates a provisional response and is to be used for informational purposes only.

5149 There are no status codes defined in IPP/1.1 for this class of status code.

5150 13.1.2 Successful Status Codes

5151 This class of status code indicates that the client's request was successfully received, understood, and
5152 accepted.

5153 13.1.2.1 successful-ok (0x0000)

5154 The request has succeeded and no request attributes were substituted or ignored. In the case of a response
5155 to a create request, the 'successful-ok' status code indicates that the request was successfully received and

5156 validated, and that the Job object has been created; it does not indicate that the job has been processed. The
5157 transition of the Job object into the 'completed' state is the only indicator that the job has been printed.

5158 13.1.2.2 successful-ok-ignored-or-substituted-attributes (0x0001)

5159 The request has succeeded, but some supplied (1) attributes were ignored or (2) unsupported values were
5160 substituted with supported values or were ignored in order to perform the operation without rejecting it.
5161 Unsupported attributes, attribute syntaxes, or values **MUST** be returned in the Unsupported Attributes
5162 group of the response for all operations. There is an exception to this rule for the query operations: Get-
5163 Printer-Attributes, Get-Jobs, and Get-Job-Attributes for the "requested-attributes" operation attribute only.
5164 When the supplied values of the "requested-attributes" operation attribute are requesting attributes that are
5165 not supported, the IPP object **MAY**, but is **NOT REQUIRED** to, return the "requested-attributes" attribute
5166 in the Unsupported Attribute response group (with the unsupported values only). See sections 3.1.7 and
5167 3.2.1.2.

5168 13.1.2.3 successful-ok-conflicting-attributes (0x0002)

5169 The request has succeeded, but some supplied attribute values conflicted with the values of other supplied
5170 attributes. These conflicting values were either (1) substituted with (supported) values or (2) the attributes
5171 were removed in order to process the job without rejecting it. Attributes or values which conflict with other
5172 attributes and have been substituted or ignored **MUST** be returned in the Unsupported Attributes group of
5173 the response for all operations as supplied by the client. See sections 3.1.7 and 3.2.1.2.

5174 13.1.3 Redirection Status Codes

5175 This class of status code indicates that further action needs to be taken to fulfill the request.

5176 There are no status codes defined in IPP/1.1 for this class of status code.

5177 13.1.4 Client Error Status Codes

5178 This class of status code is intended for cases in which the client seems to have erred. The IPP object
5179 **SHOULD** return a message containing an explanation of the error situation and whether it is a temporary or
5180 permanent condition.

5181 13.1.4.1 client-error-bad-request (0x0400)

5182 The request could not be understood by the IPP object due to malformed syntax (such as the value of a
5183 fixed length attribute whose length does not match the prescribed length for that attribute - see the
5184 Implementer's Guide [IPP-IIG]). The IPP application **SHOULD NOT** repeat the request without
5185 modifications.

5186 13.1.4.2 client-error-forbidden (0x0401)

5187 The IPP object understood the request, but is refusing to fulfill it. Additional authentication information or
5188 authorization credentials will not help and the request SHOULD NOT be repeated. This status code is
5189 commonly used when the IPP object does not wish to reveal exactly why the request has been refused or
5190 when no other response is applicable.

5191 13.1.4.3 client-error-not-authenticated (0x0402)

5192 The request requires user authentication. The IPP client may repeat the request with suitable authentication
5193 information. If the request already included authentication information, then this status code indicates that
5194 authorization has been refused for those credentials. If this response contains the same challenge as the
5195 prior response, and the user agent has already attempted authentication at least once, then the response
5196 message may contain relevant diagnostic information. This status codes reveals more information than
5197 "client-error-forbidden".

5198 13.1.4.4 client-error-not-authorized (0x0403)

5199 The requester is not authorized to perform the request. Additional authentication information or
5200 authorization credentials will not help and the request SHOULD NOT be repeated. This status code is used
5201 when the IPP object wishes to reveal that the authentication information is understandable, however, the
5202 requester is explicitly not authorized to perform the request. This status codes reveals more information
5203 than "client-error-forbidden" and "client-error-not-authenticated".

5204 13.1.4.5 client-error-not-possible (0x0404)

5205 This status code is used when the request is for something that can not happen. For example, there might
5206 be a request to cancel a job that has already been canceled or aborted by the system. The IPP client
5207 SHOULD NOT repeat the request.

5208 13.1.4.6 client-error-timeout (0x0405)

5209 The client did not produce a request within the time that the IPP object was prepared to wait. For example,
5210 a client issued a Create-Job operation and then, after a long period of time, issued a Send-Document
5211 operation and this error status code was returned in response to the Send-Document request (see section
5212 3.3.1). The IPP object might have been forced to clean up resources that had been held for the waiting
5213 additional Documents. The IPP object was forced to close the Job since the client took too long. The client
5214 SHOULD NOT repeat the request without modifications.

5215 13.1.4.7 client-error-not-found (0x0406)

5216 The IPP object has not found anything matching the request URI. No indication is given of whether the
5217 condition is temporary or permanent. For example, a client with an old reference to a Job (a URI) tries to
5218 cancel the Job, however in the mean time the Job might have been completed and all record of it at the
5219 Printer has been deleted. This status code, 'client-error-not-found' is returned indicating that the referenced

5220 Job can not be found. This error status code is also used when a client supplies a URI as a reference to the
5221 document data in either a Print-URI or Send-URI operation, but the document can not be found.

5222 In practice, an IPP application should avoid a not found situation by first querying and presenting a list of
5223 valid Printer URIs and Job URIs to the end-user.

5224 13.1.4.8 client-error-gone (0x0407)

5225 The requested object is no longer available and no forwarding address is known. This condition should be
5226 considered permanent. Clients with link editing capabilities should delete references to the request URI
5227 after user approval. If the IPP object does not know or has no facility to determine, whether or not the
5228 condition is permanent, the status code "client-error-not-found" should be used instead.

5229 This response is primarily intended to assist the task of maintenance by notifying the recipient that the
5230 resource is intentionally unavailable and that the IPP object administrator desires that remote links to that
5231 resource be removed. It is not necessary to mark all permanently unavailable resources as "gone" or to keep
5232 the mark for any length of time -- that is left to the discretion of the IPP object administrator.

5233 13.1.4.9 client-error-request-entity-too-large (0x0408)

5234 The IPP object is refusing to process a request because the request entity is larger than the IPP object is
5235 willing or able to process. An IPP Printer returns this status code when it limits the size of print jobs and it
5236 receives a print job that exceeds that limit or when the attributes are so many that their encoding causes the
5237 request entity to exceed IPP object capacity.

5238 13.1.4.10 client-error-request-value-too-long (0x0409)

5239 The IPP object is refusing to service the request because one or more of the client-supplied attributes has a
5240 variable length value that is longer than the maximum length specified for that attribute. The IPP object
5241 might not have sufficient resources (memory, buffers, etc.) to process (even temporarily), interpret, and/or
5242 ignore a value larger than the maximum length. Another use of this error code is when the IPP object
5243 supports the processing of a large value that is less than the maximum length, but during the processing of
5244 the request as a whole, the object may pass the value onto some other system component which is not able
5245 to accept the large value. For more details, see the Implementer's Guide [IPP-IIG] .

5246 Note: For attribute values that are URIs, this rare condition is only likely to occur when a client has
5247 improperly submitted a request with long query information (e.g. an IPP application allows an end-user to
5248 enter an invalid URI), when the client has descended into a URI "black hole" of redirection (e.g., a
5249 redirected URI prefix that points to a suffix of itself), or when the IPP object is under attack by a client
5250 attempting to exploit security holes present in some IPP objects using fixed-length buffers for reading or
5251 manipulating the Request-URI.

5252 13.1.4.11 client-error-document-format-not-supported (0x040A)

5253 The IPP object is refusing to service the request because the document data is in a format, as specified in
5254 the "document-format" operation attribute, that is not supported by the Printer object. This error is returned
5255 independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code,
5256 even if there are other Job Template attributes that are not supported as well, since this error is a bigger
5257 problem than with Job Template attributes. See sections 3.1.7 and 3.2.1.1. **Issue 11**

5258 13.1.4.12 client-error-attributes-or-values-not-supported (0x040B)

5259 In a create request, if the Printer object does not support one or more attributes, attribute syntaxes, or
5260 attribute values supplied in the request and the client supplied the "ipp-attributes-fidelity" operation
5261 attribute with the 'true' value, the Printer object MUST return this status code. The Printer object MUST
5262 also return in the Unsupported Attributes Group all the attributes and/or values supplied by the client that
5263 are not supported. See section 3.1.7. **Issue 11** For example, if the request indicates 'iso-a4' media, but that
5264 media type is not supported by the Printer object. Or, if the client supplies a Job Template attribute and the
5265 attribute itself is not even supported by the Printer. If the "ipp-attribute-fidelity" attribute is 'false', the
5266 Printer MUST ignore or substitute values for unsupported Job Template attributes and values rather than
5267 reject the request and return this status code.

5268 For any operation where a client requests attributes (such as a Get-Jobs, Get-Printer-Attributes, or Get-Job-
5269 Attributes operation), if the IPP object does not support one or more of the requested attributes, the IPP
5270 object simply ignores the unsupported requested attributes and processes the request as if they had not been
5271 supplied, rather than returning this status code. In this case, the IPP object MUST return the 'successful-ok-
5272 ignored-or-substituted-attributes' status code and MAY return the unsupported attributes as values of the
5273 "requested-attributes" in the Unsupported Attributes Group (see section 13.1.2.2).

5274 13.1.4.13 client-error-uri-scheme-not-supported (0x040C)

5275 The scheme of the client-supplied URI in a Print-URI or a Send-URI operation is not supported. See
5276 section 3.1.7. **Issue 11**

5277 13.1.4.14 client-error-charset-not-supported (0x040D)

5278 For any operation, if the IPP Printer does not support the charset supplied by the client in the "attributes-
5279 charset" operation attribute, the Printer MUST reject the operation and return this status and any 'text' or
5280 'name' attributes using the 'utf-8' charset (see Section 3.1.4.1). See section 3.1.7. **Issue 11**

5281 13.1.4.15 client-error-conflicting-attributes (0x040E)

5282 The request is rejected because some attribute values conflicted with the values of other attributes which
5283 this document does not permit to be substituted or ignored. The Printer object MUST also return in the
5284 Unsupported Attributes Group the conflicting attributes supplied by the client. See sections 3.1.7 and
5285 3.2.1.2. **Issue 27**

5286 13.1.4.16 client-error-compression-not-supported (0x040F) **Issue 6**

5287 The IPP object is refusing to service the request because the document data, as specified in the
5288 "compression" operation attribute, is compressed in a way that is not supported by the Printer object. This
5289 error is returned independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return
5290 this status code, even if there are other Job Template attributes that are not supported as well, since this
5291 error is a bigger problem than with Job Template attributes. **Issue 6** See sections 3.1.7 and 3.2.1.1. **Issue 11**

5292 13.1.4.17 client-error-compression-error (0x0410) **Issue 6**

5293 The IPP object is refusing to service the request because the document data cannot be decompressed when
5294 using the algorithm specified by the "compression" operation attribute. This error is returned independent
5295 of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code, even if there
5296 are Job Template attributes that are not supported as well, since this error is a bigger problem than with Job
5297 Template attributes. See sections 3.1.7 and 3.2.1.1.

5298 13.1.4.18 client-error-document-format-error (0x0411) **Issue 28**

5299 The IPP object is refusing to service the request because Printer encountered an error in the document data
5300 while interpreting it. This error is returned independent of the client-supplied "ipp-attribute-fidelity". The
5301 Printer object MUST return this status code, even if there are Job Template attributes that are not supported
5302 as well, since this error is a bigger problem than with Job Template attributes. See sections 3.1.7 and
5303 3.2.1.1.

5304 13.1.4.19 client-error-document-access-error (0x0412) **Issue 35**

5305 The IPP object is refusing to service the Print-URI or Send-URI request because Printer encountered an
5306 access error while attempting to validate the accessibility or access the document data specified in the
5307 "document-uri" operation attribute. The Printer MAY also return a specific document access error code
5308 using the "document-access-error" operation attribute (see section 3.1.6.4). This error is returned
5309 independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code,
5310 even if there are Job Template attributes that are not supported as well, since this error is a bigger problem
5311 than with Job Template attributes. See section 3.1.7.

5312 13.1.5 Server Error Status Codes

5313 This class of status codes indicates cases in which the IPP object is aware that it has erred or is incapable of
5314 performing the request. The IPP object SHOULD include a message containing an explanation of the error
5315 situation, and whether it is a temporary or permanent condition.

5316 13.1.5.1 server-error-internal-error (0x0500)

5317 The IPP object encountered an unexpected condition that prevented it from fulfilling the request. This error
5318 status code differs from "server-error-temporary-error" in that it implies a more permanent type of internal
5319 error. It also differs from "server-error-device-error" in that it implies an unexpected condition (unlike a

5320 paper-jam or out-of-toner problem which is undesirable but expected). This error status code indicates that
5321 probably some knowledgeable human intervention is required.

5322 13.1.5.2 server-error-operation-not-supported (0x0501)

5323 The IPP object does not support the functionality required to fulfill the request. This is the appropriate
5324 response when the IPP object does not recognize an operation or is not capable of supporting it. See section
5325 3.1.7. **Issue 18**

5326 13.1.5.3 server-error-service-unavailable (0x0502)

5327 The IPP object is currently unable to handle the request due to a temporary overloading or maintenance of
5328 the IPP object. The implication is that this is a temporary condition which will be alleviated after some
5329 delay. If known, the length of the delay may be indicated in the message. If no delay is given, the IPP
5330 application should handle the response as it would for a "server-error-temporary-error" response. If the
5331 condition is more permanent, the error status codes "client-error-gone" or "client-error-not-found" could be
5332 used.

5333 13.1.5.4 server-error-version-not-supported (0x0503)

5334 The IPP object does not support, or refuses to support, the IPP protocol version that was supplied as the
5335 value of the "version-number" operation parameter in the request. The IPP object is indicating that it is
5336 unable or unwilling to complete the request using the same major and minor version number as supplied in
5337 the request other than with this error message. The error response SHOULD contain a "status-message"
5338 attribute (see section 3.1.6.2) describing why that version is not supported and what other versions are
5339 supported by that IPP object. See section 3.1.8. **Issue 11**

5340 The error response MUST identify in the "version-number" operation parameter the closest version number
5341 that the IPP object does support. For example, if a client supplies version '1.0' and an IPP/1.1 object
5342 supports version '1.0', then it MUST respond with version '1.0' in all responses to such a request. If the
5343 IPP/1.1 object does not support version '1.0', then it SHOULD accept the request and respond with version
5344 '1.1' or MAY reject the request and respond with this error code and version '1.1'. If a client supplies a
5345 version '1.2' the IPP/1.1 object SHOULD accept the request and return version '1.1' or MAY reject the
5346 request and respond with this error code and version '1.1'. See sections 3.1.8 and 4.4.14. **Issue 36**

5347 13.1.5.5 server-error-device-error (0x0504)

5348 A printer error, such as a paper jam, occurs while the IPP object processes a Print or Send operation. The
5349 response contains the true Job Status (the values of the "job-state" and "job-state-reasons" attributes).
5350 Additional information can be returned in the OPTIONAL "job-state-message" attribute value or in the
5351 OPTIONAL status message that describes the error in more detail. This error status code is only returned in
5352 situations where the Printer is unable to accept the create request because of such a device error. For
5353 example, if the Printer is unable to spool, and can only accept one job at a time, the reason it might reject a
5354 create request is that the printer currently has a paper jam. In many cases however, where the Printer object
5355 can accept the request even though the Printer has some error condition, the 'successful-ok' status code will

5356 be returned. In such a case, the client would look at the returned Job Object Attributes or later query the
5357 Printer to determine its state and state reasons.

5358 13.1.5.6 server-error-temporary-error (0x0505)

5359 A temporary error such as a buffer full write error, a memory overflow (i.e. the document data exceeds the
5360 memory of the Printer), or a disk full condition, occurs while the IPP Printer processes an operation. The
5361 client MAY try the unmodified request again at some later point in time with an expectation that the
5362 temporary internal error condition may have been cleared. Alternatively, as an implementation option, a
5363 Printer object MAY delay the response until the temporary condition is cleared so that no error is returned.

5364 13.1.5.7 server-error-not-accepting-jobs (0x0506)

5365 A temporary error indicating that the Printer is not currently accepting jobs, because the administrator has
5366 set the value of the Printer's "printer-is-not-accepting-jobs" attribute to 'false' (by means outside the scope of
5367 this IPP/1.1 document).

5368 13.1.5.8 server-error-busy (0x0507)

5369 A temporary error indicating that the Printer is too busy processing jobs and/or other requests. The client
5370 SHOULD try the unmodified request again at some later point in time with an expectation that the
5371 temporary busy condition will have been cleared.

5372 13.1.5.9 server-error-job-canceled (0x0508)

5373 An error indicating that the job has been canceled by an operator or the system while the client was
5374 transmitting the data to the IPP Printer. If a job-id and job-uri had been created, then they are returned in
5375 the Print-Job, Send-Document, or Send-URI response as usual; otherwise, no job-id and job-uri are returned
5376 in the response.

5377 13.1.5.10 server-error-multiple-document-jobs-not-supported (0x0509) **Issue 34**

5378 The IPP object does not support multiple documents per job and a client attempted to supply document data
5379 with a second Send-Document or Send-URI operation.

5468 14. APPENDIX C: "media" keyword values

5469 Standard keyword values are taken from several sources.

5470 Standard values are defined (taken from DPA[ISO10175] and the Printer MIB[RFC1759]):

- 5471 'default': The default medium for the output device
- 5472 'iso-a4-white': Specifies the ISO A4 white medium
- 5473 'iso-a4-colored': Specifies the ISO A4 colored medium
- 5474 'iso-a4-transparent': Specifies the ISO A4 transparent medium
- 5475 'iso-a3-white': Specifies the ISO A3 white medium
- 5476 'iso-a3-colored': Specifies the ISO A3 colored medium
- 5477 'iso-a5-white': Specifies the ISO A5 white medium
- 5478 'iso-a5-colored': Specifies the ISO A5 colored medium
- 5479 'iso-b4-white': Specifies the ISO B4 white medium
- 5480 'iso-b4-colored': Specifies the ISO B4 colored medium
- 5481 'iso-b5-white': Specifies the ISO B5 white medium
- 5482 'iso-b5-colored': Specifies the ISO B5 colored medium
- 5483 'jis-b4-white': Specifies the JIS B4 white medium
- 5484 'jis-b4-colored': Specifies the JIS B4 colored medium
- 5485 'jis-b5-white': Specifies the JIS B5 white medium
- 5486 'jis-b5-colored': Specifies the JIS B5 colored medium

5487

5488 The following standard values are defined for North American media:

- 5489 'na-letter-white': Specifies the North American letter white medium
- 5490 'na-letter-colored': Specifies the North American letter colored medium
- 5491 'na-letter-transparent': Specifies the North American letter transparent medium
- 5492 'na-legal-white': Specifies the North American legal white medium
- 5493 'na-legal-colored': Specifies the North American legal colored medium

5494

5495 The following standard values are defined for envelopes:

- 5496 'iso-b4-envelope': Specifies the ISO B4 envelope medium
- 5497 'iso-b5-envelope': Specifies the ISO B5 envelope medium
- 5498 'iso-c3-envelope': Specifies the ISO C3 envelope medium
- 5499 'iso-c4-envelope': Specifies the ISO C4 envelope medium
- 5500 'iso-c5-envelope': Specifies the ISO C5 envelope medium
- 5501 'iso-c6-envelope': Specifies the ISO C6 envelope medium
- 5502 'iso-designated-long-envelope': Specifies the ISO Designated Long envelope medium
- 5503 'na-10x13-envelope': Specifies the North American 10x13 envelope medium
- 5504 'na-9x12-envelope': Specifies the North American 9x12 envelope medium

5505 'monarch-envelope': Specifies the Monarch envelope
5506 'na-number-10-envelope': Specifies the North American number 10 business envelope medium
5507 'na-7x9-envelope': Specifies the North American 7x9 inch envelope
5508 'na-9x11-envelope': Specifies the North American 9x11 inch envelope
5509 'na-10x14-envelope': Specifies the North American 10x14 inch envelope
5510 'na-number-9-envelope': Specifies the North American number 9 business envelope
5511 'na-6x9-envelope': Specifies the North American 6x9 inch envelope
5512 'na-10x15-envelope': Specifies the North American 10x15 inch envelope
5513

5514 The following standard values are defined for the less commonly used media (white-only):

5515 'executive-white': Specifies the white executive medium
5516 'folio-white': Specifies the folio white medium
5517 'invoice-white': Specifies the white invoice medium
5518 'ledger-white': Specifies the white ledger medium
5519 'quarto-white': Specified the white quarto medium
5520 'iso-a0-white': Specifies the ISO A0 white medium
5521 'iso-a1-white': Specifies the ISO A1 white medium
5522 'iso-a2-white': Specifies the ISO A2 white medium
5523 'iso-a6-white': Specifies the ISO A6 white medium
5524 'iso-a7-white': Specifies the ISO A7 white medium
5525 'iso-a8-white': Specifies the ISO A8 white medium
5526 'iso-a9-white': Specifies the ISO A9 white medium
5527 'iso-10-white': Specifies the ISO A10 white medium
5528 'iso-b0-white': Specifies the ISO B0 white medium
5529 'iso-b1-white': Specifies the ISO B1 white medium
5530 'iso-b2-white': Specifies the ISO B2 white medium
5531 'iso-b3-white': Specifies the ISO B3 white medium
5532 'iso-b6-white': Specifies the ISO B6 white medium
5533 'iso-b7-white': Specifies the ISO B7 white medium
5534 'iso-b8-white': Specifies the ISO B8 white medium
5535 'iso-b9-white': Specifies the ISO B9 white medium
5536 'iso-b10-white': Specifies the ISO B10 white medium
5537 'jis-b0-white': Specifies the JIS B0 white medium
5538 'jis-b1-white': Specifies the JIS B1 white medium
5539 'jis-b2-white': Specifies the JIS B2 white medium
5540 'jis-b3-white': Specifies the JIS B3 white medium
5541 'jis-b6-white': Specifies the JIS B6 white medium
5542 'jis-b7-white': Specifies the JIS B7 white medium
5543 'jis-b8-white': Specifies the JIS B8 white medium
5544 'jis-b9-white': Specifies the JIS B9 white medium
5545 'jis-b10-white': Specifies the JIS B10 white medium
5546

5547 The following standard values are defined for engineering media (white only):

5548 'a-white': Specifies the engineering A size medium
 5549 'b-white': Specifies the engineering B size medium
 5550 'c-white': Specifies the engineering C size medium
 5551 'd-white': Specifies the engineering D size medium
 5552 'e-white': Specifies the engineering E size medium
 5553

5554 The following standard values are defined for input-trays (from ISO DPA and the Printer MIB):

5555 'top': The top input tray in the printer.
 5556 'middle': The middle input tray in the printer.
 5557 'bottom': The bottom input tray in the printer.
 5558 'envelope': The envelope input tray in the printer.
 5559 'manual': The manual feed input tray in the printer.
 5560 'large-capacity': The large capacity input tray in the printer.
 5561 'main': The main input tray
 5562 'side': The side input tray
 5563

5564 The following standard values are defined for media sizes (from ISO DPA):

5565 'iso-a0': Specifies the ISO A0 size: 841 mm by 1189 mm as defined in ISO 216
 5566 'iso-a1': Specifies the ISO A1 size: 594 mm by 841 mm as defined in ISO 216
 5567 'iso-a2': Specifies the ISO A2 size: 420 mm by 594 mm as defined in ISO 216
 5568 'iso-a3': Specifies the ISO A3 size: 297 mm by 420 mm as defined in ISO 216
 5569 'iso-a4': Specifies the ISO A4 size: 210 mm by 297 mm as defined in ISO 216
 5570 'iso-a5': Specifies the ISO A5 size: 148 mm by 210 mm as defined in ISO 216
 5571 'iso-a6': Specifies the ISO A6 size: 105 mm by 148 mm as defined in ISO 216
 5572 'iso-a7': Specifies the ISO A7 size: 74 mm by 105 mm as defined in ISO 216
 5573 'iso-a8': Specifies the ISO A8 size: 52 mm by 74 mm as defined in ISO 216
 5574 'iso-a9': Specifies the ISO A9 size: 37 mm by 52 mm as defined in ISO 216
 5575 'iso-a10': Specifies the ISO A10 size: 26 mm by 37 mm as defined in ISO 216
 5576 'iso-b0': Specifies the ISO B0 size: 1000 mm by 1414 mm as defined in ISO 216
 5577 'iso-b1': Specifies the ISO B1 size: 707 mm by 1000 mm as defined in ISO 216
 5578 'iso-b2': Specifies the ISO B2 size: 500 mm by 707 mm as defined in ISO 216
 5579 'iso-b3': Specifies the ISO B3 size: 353 mm by 500 mm as defined in ISO 216
 5580 'iso-b4': Specifies the ISO B4 size: 250 mm by 353 mm as defined in ISO 216
 5581 'iso-b5': Specifies the ISO B5 size: 176 mm by 250 mm as defined in ISO 216
 5582 'iso-b6': Specifies the ISO B6 size: 125 mm by 176 mm as defined in ISO 216
 5583 'iso-b7': Specifies the ISO B7 size: 88 mm by 125 mm as defined in ISO 216
 5584 'iso-b8': Specifies the ISO B8 size: 62 mm by 88 mm as defined in ISO 216
 5585 'iso-b9': Specifies the ISO B9 size: 44 mm by 62 mm as defined in ISO 216
 5586 'iso-b10': Specifies the ISO B10 size: 31 mm by 44 mm as defined in ISO 216
 5587 'na-letter': Specifies the North American letter size: 8.5 inches by 11 inches
 5588 'na-legal': Specifies the North American legal size: 8.5 inches by 14 inches
 5589 'executive': Specifies the executive size (7.25 X 10.5 in)
 5590 'folio': Specifies the folio size (8.5 X 13 in)

5591 'invoice': Specifies the invoice size (5.5 X 8.5 in)
5592 'ledger': Specifies the ledger size (11 X 17 in)
5593 'quarto': Specifies the quarto size (8.5 X 10.83 in)
5594 'iso-c3': Specifies the ISO C3 size: 324 mm by 458 mm as defined in ISO 269
5595 'iso-c4': Specifies the ISO C4 size: 229 mm by 324 mm as defined in ISO 269
5596 'iso-c5': Specifies the ISO C5 size: 162 mm by 229 mm as defined in ISO 269
5597 'iso-c6': Specifies the ISO C6 size: 114 mm by 162 mm as defined in ISO 269
5598 'iso-designated-long': Specifies the ISO Designated Long size: 110 mm by 220 mm as defined in ISO
5599 269
5600 'na-10x13-envelope': Specifies the North American 10x13 size: 10 inches by 13 inches
5601 'na-9x12-envelope': Specifies the North American 9x12 size: 9 inches by 12 inches
5602 'na-number-10-envelope': Specifies the North American number 10 business envelope size: 4.125
5603 inches by 9.5 inches
5604 'na-7x9-envelope': Specifies the North American 7x9 inch envelope size
5605 'na-9x11-envelope': Specifies the North American 9x11 inch envelope size
5606 'na-10x14-envelope': Specifies the North American 10x14 inch envelope size
5607 'na-number-9-envelope': Specifies the North American number 9 business envelope size
5608 'na-6x9-envelope': Specifies the North American 6x9 envelope size
5609 'na-10x15-envelope': Specifies the North American 10x15 envelope size
5610 'monarch-envelope': Specifies the Monarch envelope size (3.87 x 7.5 in)
5611 'jis-b0': Specifies the JIS B0 size: 1030mm x 1456mm
5612 'jis-b1': Specifies the JIS B1 size: 728mm x 1030mm
5613 'jis-b2': Specifies the JIS B2 size: 515mm x 728mm
5614 'jis-b3': Specifies the JIS B3 size: 364mm x 515mm
5615 'jis-b4': Specifies the JIS B4 size: 257mm x 364mm
5616 'jis-b5': Specifies the JIS B5 size: 182mm x 257mm
5617 'jis-b6': Specifies the JIS B6 size: 128mm x 182mm
5618 'jis-b7': Specifies the JIS B7 size: 91mm x 128mm
5619 'jis-b8': Specifies the JIS B8 size: 64mm x 91mm
5620 'jis-b9': Specifies the JIS B9 size: 45mm x 64mm
5621 'jis-b10': Specifies the JIS B10 size: 32mm x 45mm

5622 The following standard values are defined for engineering media sizes:

5623 'a': Specifies the engineering A size: 8.5 inches x 11 inches
5624 'b': Specifies the engineering B size: 11 inches x 17 inches
5625 'c': Specifies the engineering C size: 17 inches x 22 inches
5626 'd': Specifies the engineering D size: 22 inches x 34 inches
5627 'e': Specifies the engineering E size: 34 inches x 44 inches
5628

5629 15. APPENDIX D: Processing IPP Attributes

5630 When submitting a print job to a Printer object, the IPP model allows a client to supply operation and Job
5631 Template attributes along with the document data. These Job Template attributes in the create request

5632 affect the rendering, production and finishing of the documents in the job. Similar types of instructions
5633 may also be contained in the document to be printed, that is, embedded within the print data itself. In
5634 addition, the Printer has a set of attributes that describe what rendering and finishing options which are
5635 supported by that Printer. This model, which allows for flexibility and power, also introduces the potential
5636 that at job submission time, these client-supplied attributes may conflict with either:

- 5637 - what the implementation is capable of realizing (i.e., what the Printer supports), as well as
- 5638 - the instructions embedded within the print data itself.

5639

5640 The following sections describe how these two types of conflicts are handled in the IPP model.

5641 15.1 Fidelity

5642 If there is a conflict between what the client requests and what a Printer object supports, the client may
5643 request one of two possible conflict handling mechanisms:

- 5644 1) either reject the job since the job can not be processed exactly as specified, or
- 5645 2) allow the Printer to make any changes necessary to proceed with processing the Job the best it can.

5646

5647 In the first case the client is indicating to the Printer object: "Print the job exactly as specified with no
5648 exceptions, and if that can't be done, don't even bother printing the job at all." In the second case, the client
5649 is indicating to the Printer object: "It is more important to make sure the job is printed rather than be
5650 processed exactly as specified; just make sure the job is printed even if client supplied attributes need to be
5651 changed or ignored."

5652 The IPP model accounts for this situation by introducing an "ipp-attribute-fidelity" attribute.

5653 In a create request, "ipp-attribute-fidelity" is a boolean operation attribute that is **OPTIONALLY** supplied
5654 by the client. The value 'true' indicates that total fidelity to client supplied Job Template attributes and
5655 values is required. The client is requesting that the Job be printed exactly as specified, and if that is not
5656 possible then the job **MUST** be rejected rather than processed incorrectly. The value 'false' indicates that a
5657 reasonable attempt to print the Job is acceptable. If a Printer does not support some of the client supplied
5658 Job Template attributes or values, the Printer **MUST** ignore them or substitute any supported value for
5659 unsupported values, respectively. The Printer may choose to substitute the default value associated with
5660 that attribute, or use some other supported value that is similar to the unsupported requested value. For
5661 example, if a client supplies a "media" value of 'na-letter', the Printer may choose to substitute 'iso-a4' rather
5662 than a default value of 'envelope'. If the client does not supply the "ipp-attribute-fidelity" attribute, the
5663 Printer assumes a value of 'false'.

5664 Each Printer implementation **MUST** support both types of "fidelity" printing (that is whether the client
5665 supplies a value of 'true' or 'false');

- 5666 - If the client supplies 'false' or does not supply the attribute, the Printer object **MUST** always accept the
5667 request by ignoring unsupported Job Template attributes and by substituting unsupported values of
5668 supported Job Template attributes with supported values.

5669 - If the client supplies 'true', the Printer object MUST reject the request if the client supplies
5670 unsupported Job Template attributes.
5671

5672 Since a client can always query a Printer to find out exactly what is and is not supported, "ipp-attribute-
5673 fidelity" set to 'false' is useful when:

- 5674 1) The End-User uses a command line interface to request attributes that might not be supported.
- 5675 2) In a GUI context, if the End User expects the job might be moved to another printer and prefers a
5676 sub-optimal result to nothing at all.
- 5677 3) The End User just wants something reasonable in lieu of nothing at all.
5678

5679 15.2 Page Description Language (PDL) Override

5680 If there is a conflict between the value of an IPP Job Template attribute and a corresponding instruction in
5681 the document data, the value of the IPP attribute SHOULD take precedence over the document instruction.
5682 Consider the case where a previously formatted file of document data is sent to an IPP Printer. In this case,
5683 if the client supplies any attributes at job submission time, the client desires that those attributes override
5684 the embedded instructions. Consider the case where a previously formatted document has embedded in it
5685 commands to load 'iso-a4' media. However, the document is passed to an end user that only has access to a
5686 printer with 'na-letter' media loaded. That end user most likely wants to submit that document to an IPP
5687 Printer with the "media" Job Template attribute set to 'na-letter'. The job submission attribute should take
5688 precedence over the embedded PDL instruction. However, until companies that supply document data
5689 interpreters allow a way for external IPP attributes to take precedence over embedded job production
5690 instructions, a Printer might not be able to support the semantics that IPP attributes override the embedded
5691 instructions.

5692 The IPP model accounts for this situation by introducing a "pdl-override-supported" attribute that describes
5693 the Printer objects capabilities to override instructions embedded in the PDL data stream. The value of the
5694 "pdl-override-supported" attribute is configured by means outside the scope of this IPP/1.1 document.

5695 This REQUIRED Printer attribute takes on the following values:

- 5696 - 'attempted': This value indicates that the Printer object attempts to make the IPP attribute values take
5697 precedence over embedded instructions in the document data, however there is no guarantee.
- 5698 - 'not-attempted': This value indicates that the Printer object makes no attempt to make the IPP attribute
5699 values take precedence over embedded instructions in the document data.
5700

5701 At job processing time, an implementation that supports the value of 'attempted' might do one of several
5702 different actions:

- 5703 1) Generate an output device specific command sequence to realize the feature represented by the IPP
5704 attribute value.
- 5705 2) Parse the document data itself and replace the conflicting embedded instruction with a new
5706 embedded instruction that matches the intent of the IPP attribute value.

- 5707 3) Indicate to the Printer that external supplied attributes take precedence over embedded instructions
5708 and then pass the external IPP attribute values to the document data interpreter.
5709 4) Anything else that allows for the semantics that IPP attributes override embedded document data
5710 instructions.
5711

5712 Since 'attempted' does not offer any type of guarantee, even though a given Printer object might not do a
5713 very "good" job of attempting to ensure that IPP attributes take a higher precedence over instructions
5714 embedded in the document data, it would still be a conforming implementation.

5715 At job processing time, an implementation that supports the value of 'not-attempted' might do one of the
5716 following actions:

- 5717 1) Simply pre-pend the document data with the PDL instruction that corresponds to the client-supplied
5718 PDL attribute, such that if the document data also has the same PDL instruction, it will override
5719 what the Printer object pre-pended. In other words, this implementation is using the same
5720 implementation semantics for the client-supplied IPP attributes as for the Printer object defaults.
5721 2) Parse the document data and replace the conflicting embedded instruction with a new embedded
5722 instruction that approximates, but does not match, the semantic intent of the IPP attribute value.
5723

5724 Note: The "ipp-attribute-fidelity" attribute applies to the Printer's ability to either accept or reject other
5725 unsupported Job Template attributes. In other words, if "ipp-attribute-fidelity" is set to 'true', a Job is
5726 accepted if and only if the client supplied Job Template attributes and values are supported by the Printer.
5727 Whether these attributes actually affect the processing of the Job when the document data contains
5728 embedded instructions depends on the ability of the Printer to override the instructions embedded in the
5729 document data with the semantics of the IPP attributes. If the document data attributes can be overridden
5730 ("pdl-override-supported" set to 'attempted'), the Printer makes an attempt to use the IPP attributes when
5731 processing the Job. If the document data attributes can not be overridden ("pdl-override-supported" set to
5732 'not-attempted'), the Printer makes no attempt to override the embedded document data instructions with the
5733 IPP attributes when processing the Job, and hence, the IPP attributes may fail to affect the Job processing
5734 and output when the corresponding instruction is embedded in the document data.

5735 15.3 Using Job Template Attributes During Document Processing.

5736 The Printer object uses some of the Job object's Job Template attributes during the processing of the
5737 document data associated with that job. These include, but are not limited to, "orientation-requested",
5738 "number-up", "sides", "media", and "copies". The processing of each document in a Job Object MUST
5739 follow the steps below. These steps are intended only to identify when and how attributes are to be used in
5740 processing document data and any alternative steps that accomplishes the same effect can be used to
5741 implement this specification document.

- 5742 1. Using the client supplied "document-format" attribute or some form of document format detection
5743 algorithm (if the value of "document-format" is not specific enough), determine whether or not the
5744 document data has already been formatted for printing. If the document data has been formatted,
5745 then go to step 2. Otherwise, the document data MUST be formatted. The formatting detection
5746 algorithm is implementation defined and is not specified by this document. The formatting of the

5747 document data uses the "orientation-requested" attribute to determine how the formatted print data
5748 should be placed on a print-stream page, see section 4.2.10 for the details.

5749

5750

2. The document data is in the form of a print-stream in a known media type. The "page-ranges" attribute is used to select, as specified in section 4.2.7, a sub-sequence of the pages in the print-stream that are to be processed and images.

5752

5753

5754

3. The input to this step is a sequence of print-stream pages. This step is controlled by the "number-up" attribute. If the value of "number-up" is N, then during the processing of the print-stream pages, each N print-stream pages are positioned, as specified in section 4.2.9, to create a single impression. If a given document does not have N more print-stream pages, then the completion of the impression is controlled by the "multiple-document-handling" attribute as described in section 4.2.4; when the value of this attribute is 'single-document' or 'single-document-new-sheet', the print-stream pages of document data from subsequent documents is used to complete the impression.

5755

5756

5757

5758

5759

5760

5761

The size(scaling), position(translation) and rotation of the print-stream pages on the impression is implementation defined. Note that during this process the print-stream pages may be rendered to a form suitable for placing on the impression; this rendering is controlled by the values of the "printer-resolution" and "print-quality" attributes as described in sections 4.2.12 and 4.2.13. In the case N=1, the impression is nearly the same as the print-stream page; the differences would only be in the size, position and rotation of the print-stream page and/or any decoration, such as a frame to the page, that is added by the implementation.

5762

5763

5764

5765

5766

5767

5768

5769

4. The collection of impressions is placed, in sequence, onto sides of the media sheets. This placement is controlled by the "sides" attribute and the orientation of the print-stream page, as described in section 4.2.8. The orientation of the print-stream pages affects the orientation of the impression; for example, if "number-up" equals 2, then, typically, two portrait print-stream pages become one landscape impression. Note that the placement of impressions onto media sheets is also controlled by the "multiple-document-handling" attribute as described in section 4.2.4.

5770

5771

5772

5773

5774

5775

5776

5. The "copies" and "multiple-document-handling" attributes are used to determine how many copies of each media instance are created and in what order. See sections 4.2.5 and 4.2.4 for the details.

5777

5778

5779

6. When the correct number of copies are created, the media instances are finished according to the values of the "finishings" attribute as described in 4.2.6. Note that sometimes finishing operations may require manual intervention to perform the finishing operations on the copies, especially uncollated copies. This document allows any or all of the processing steps to be performed automatically or manually at the discretion of the Printer object.

5780

5781

5782

5783

5784

5785 16. APPENDIX E: Generic Directory Schema

5786 This section defines a generic schema for an entry in a directory service. A directory service is a means by
5787 which service users can locate service providers. In IPP environments, this means that IPP Printers can be
5788 registered (either automatically or with the help of an administrator) as entries of type printer in the

5789 directory using an implementation specific mechanism such as entry attributes, entry type fields, specific
 5790 branches, etc. IPP clients can search or browse for entries of type printer. Clients use the directory service
 5791 to find entries based on naming, organizational contexts, or filtered searches on attribute values of entries.
 5792 For example, a client can find all printers in the "Local Department" context. Authentication and
 5793 authorization are also often part of a directory service so that an administrator can place limits on end users
 5794 so that they are only allowed to find entries to which they have certain access rights. IPP itself does not
 5795 require any specific directory service protocol or provider.

5796 Note: Some directory implementations allow for the notion of "aliasing". That is, one directory entry object
 5797 can appear as multiple directory entry object with different names for each object. In each case, each alias
 5798 refers to the same directory entry object which refers to a single IPP Printer object.

5799 The generic schema is a subset of IPP Printer Job Template and Printer Description attributes (sections 4.2
 5800 and 4.4). These attributes are identified as either RECOMMENDED or OPTIONAL for the directory entry
 5801 itself. This conformance labeling is NOT the same conformance labeling applied to the attributes of IPP
 5802 Printers objects. The conformance labeling in this Appendix is intended to apply to directory templates and
 5803 to IPP Printer implementations that subscribe by adding one or more entries to a directory.
 5804 RECOMMENDED attributes SHOULD be associated with each directory entry. OPTIONAL attributes
 5805 MAY be associated with the directory entry (if known or supported). In addition, all directory entry
 5806 attributes SHOULD reflect the current attribute values for the corresponding Printer object.

5807 The names of attributes in directory schema and entries SHOULD be the same as the IPP Printer attribute
 5808 names as shown.

5809 In order to bridge between the directory service and the IPP Printer object, one of the RECOMMENDED
 5810 directory entry attributes is the Printer object's "printer-uri-supported" attribute. The IPP client queries the
 5811 "printer-uri-supported" attribute in the directory entry and then addresses the IPP Printer object using one of
 5812 its URIs. The "uri-security-supported" attribute identifies the protocol (if any) used to secure a channel.

5813 The following attributes define the generic schema for directory entries of type PRINTER:

5814	printer-uri-supported	RECOMMENDED	Section 4.4.1
5815	uri-authentication-supported	RECOMMENDED	Section 4.4.2
5816	uri-security-supported	RECOMMENDED	Section 4.4.3
5817	printer-name	RECOMMENDED	Section 4.4.4
5818	printer-location	RECOMMENDED	Section 4.4.5
5819	printer-info	OPTIONAL	Section 4.4.6
5820	printer-more-info	OPTIONAL	Section 4.4.7

5840 17. APPENDIX F: Differences between the IPP/1.0 and IPP/1.1 "Model and Semantics" Documents

5841 This Appendix is divided into two lists that summarize the differences between IPP/1.1 (this document) and
5842 IPP/1.0 [RFC2566]. The section numbers refer to the numbers in this document which in some cases have
5843 changed from RFC 2566. When a change affects multiple sections, the item is listed once in the order of
5844 the first section affected and the remaining affected section numbers are indicated.

5845 The first list contains extensions and clarifications and the second list contains changes in semantics or
5846 conformance. However, client and IPP object implementations of IPP/1.0 MAY implement any of the
5847 extensions and clarifications in this document.

5848 The following extensions and clarifications have been incorporated into this document:

- 5849 1. Section 2.1 - clarified that the term "client" can be either contained in software controlled by an end
5850 user or a part of a print server that controls devices. **Issue 4**
- 5851 2. Section 2 - clarified that the term "IPP object" and "Printer object" can either be embedded in a
5852 device object or part of a print server that accepts IPP requests. **Issue 4**
- 5853 3. Section 2.4 - added the description of the new "uri-authentication-supported" Printer Description
5854 attribute. **Issue 2**
- 5855 4. Section 3.1.3, 3.1.6, 3.2.5.2, and 3.2.6.2 - clarified the error handling for operation attributes that
5856 have their own status code. **Issues 18, 23, and 27**
- 5857 5. Section 3.1.6 - reorganized this section into sub-sections to separately describe "status-code",
5858 "status-message", "detailed-status-message", and "document-access-error" attributes. **Issue 18**
- 5859 6. Section 3.1.6.1 - clarified the error status codes and their relationship to operation attributes. **Issue**
5860 **18**
- 5861 7. Section 3.1.6.3 - Added the OPTIONAL "detailed-status-message (text(MAX))" operation attribute
5862 to provide additional more detailed information about a response. **Issue 35**
- 5863 8. Section 3.1.6.4 and 3.2.2 - Added the OPTIONAL "document-access-error (text(MAX))" operation
5864 attribute for use with Print-URI and Send-URI responses. **Issue 35**
- 5865 9. Sections 3.1.7 - Added this new section to clarify returning Unsupported Attributes for all
5866 operations, including only returning attributes that were in the request. Moved the text from section
5867 3.2.1.2 Unsupported Attributes to this section. **Issues 18, 23, and 27**
- 5868 10. Sections 3.1.7 and 4.1 - clarified the encoding of the "out-of-band" 'unsupported' and 'unknown'
5869 values. **Issues 12 and 15**
- 5870 11. Section 3.1.8 - clarified that only the version number parameter will be carried forward into future
5871 major or minor versions of the protocol.
- 5872 12. Section 3.1.8 - relaxed the requirements to increment the major version number in future versions of
5873 the Model and Semantics document. **Issue 33**
- 5874 13. Section 3.1.9, and 3.2.5 - added the 'processing' state to the list of job states that a job can be in after
5875 a Create-Job operation. **Issue 13**
- 5876 14. Section 3.1.9 - clarified that a non-spooling Printer MAY accept zero or more subsequent jobs while
5877 processing a job and flow control them down. Subsequent create requests are rejected with the
5878 'server-error-busy' error status. **Issue 20**

- 5879 15. Section 3.2.1.1 - clarified the validation of the "compression" operation attribute and its relationship
5880 to the validation of the "document-format" attribute and returning Unsupported Attributes. **Issues 6,**
5881 **Issue 11, and Issue 28**
- 5882 16. Sections 3.2.1.1, 4.3.8, 13.1.4.16, and 13.1.4.17 - added the 'client-error-compression-not-
5883 supported', 'client-error-compression-error' status codes and the 'unsupported-compression' and
5884 'compression-error' job-state-reasons. **Issue 28**
- 5885 17. Sections 3.2.1.1 and 4.3.8 - added 'unsupported-document-format' and 'document-format-error' job-
5886 state-reasons. **Issue 3**
- 5887 18. Sections 3.2.2, 4.3.8 and 13.1.4.19 - added 'client-error-document-access-error' status code and
5888 'document-access-error' job state reason. **Issue 35**
- 5889 19. Section 3.2.5.2 and 3.2.6.2 - clarified that the Unsupported Attributes group MUST NOT include
5890 attributes not requested in the Get-Printer-Attributes request. **Issue 23**
- 5891 20. Section 3.2.6 - clarified that "limit" takes precedence over "which-jobs" and "my-jobs". **Issue 8**
- 5892 21. Section 3.2.6.2 - clarified that Get-Jobs returns 'successful-ok' when no jobs to return. **Issue 24**
- 5893 22. Sections 3.2.7, 3.2.8, and 3.2.9 - added the OPTIONAL Pause-Printer, Resume-Printer, and Purge-
5894 Jobs operations
- 5895 23. Section 3.3.1 - clarified that the authorization required for a Send-Document request MUST be the
5896 same user as the Create-Job or an operator. **Issue 19**
- 5897 24. Sections 3.3.5, 3.3.6, and 3.3.7 - added the OPTIONAL Hold-Job, Release-Job, and Restart-Job
5898 operations.
- 5899 25. Section 4.1 - clarified that the encoding of the out-of-band values are specified in the Encoding and
5900 Transport" document. **Issue 12 and Issue 15**
- 5901 26. Section 4.1.9.1 - clarified that 'application/octet-stream' auto-sensing can happen at create request
5902 time and/or job/document processing time. **Issue 9 and Issue 10**
- 5903 27. Section 4.1.14 - clarified that the localization of dateTime by the client includes the time zone.
5904 **Issue 17**
- 5905 28. Section 4.2 - clarified that xxx-supported have multiple keywords and/or names by adding
5906 parentheses to the table to give: (1setOf (type3 keyword | name))
- 5907 29. Section 4.2.2 - added the 'indefinite' keyword value to the "job-hold-until" attribute for use with the
5908 create operations and Hold-Job and Restart-Job operations.
- 5909 30. Section 4.2.6 - added more enum values to the "finishings" Job Template attribute.
- 5910 31. Section 4.3.7 - added that a forwarding server that cannot get any job state MAY return the job's
5911 state as 'completed', provided that it also return the new 'queued-in-device' job state reason. **Issue 14**
- 5912 32. Section 4.3.7.2 - added the Partitioning of Job States section to clarify the concepts of Job
5913 Retention, Job History, and Job Removal.
- 5914 33. Section 4.3.8 - added 'job-data-insufficient' job state reason to indicate whether sufficient data has
5915 arrived for the document to start to be processed. **Issue 13**
- 5916 34. Section 4.3.8 - added 'document-access-error' job state reason to indicate an access error of any kind.
5917 **Issue 35**
- 5918 35. Section 4.3.8 - added 'job-queued-for-marker' job state reason to indicate whether the job has
5919 completed some processing and is waiting for the marker. **Issue 31**
- 5920 36. Section 4.3.8 - added 'unsupported-compression' and 'compression-error' job state reasons to
5921 indicate compression not supported or compression processing error after the create has been
5922 accepted. **Issue 6**

- 5923 37. Section 4.3.8 - added 'unsupported-document-format' and 'document-format-error' job state reasons
5924 to indicate document not supported or document format processing error after the create has been
5925 accepted. [Issue 3](#)
- 5926 38. Section 4.3.8 - added 'queued-in-device' job state reason to indicate that a job as been forwarded to a
5927 print system or device that does not provide any job status. [Issue 14](#)
- 5928 39. Section 4.3.10 - added "job-detailed-status-messages (1setOf text(MAX)) for returning detailed
5929 error messages. [Issue 35](#)
- 5930 40. Section 4.3.11 - added the "job-document-access-errors (1setOf text(MAX)) [Issue 35](#)
- 5931 41. Section 4.3.14.2 - clarified that the time recorded is the first time processing since the create
5932 operation or the Restart-Job operation. [Issue 17](#)
- 5933 42. Section 4.3.14.2 and 4.3.14.3 - clarified that the out-of-band value 'no-value' is returned if the job
5934 has not started processing or has not completed, respectively. [Issue 17](#)
- 5935 43. Section 4.3.14 - Added the OPTIONAL "date-time-at-creation", "date-time-at-processing", and
5936 "date-time-at-completed" Event Time Job Description attributes [Issue 17](#)
- 5937 44. Section 4.4.3 - added the 'tls' value to "uri-security-supported" attribute.
- 5938 45. Section 4.4.3 - clarified "uri-security-supported" is orthogonal to Client Authentication so that 'none'
5939 does not exclude Client Authentication. [Issue 2](#)
- 5940 46. Section 4.4.11 - simplified the "printer-state" descriptions while generalizing to allow high end
5941 devices that interpret one or more jobs while marking another. Indicated that 'spool-area-full' and
5942 'stopped-partly' "printer-state-reasons" may be used to provide further state information. [Issue 31](#)
- 5943 47. Section 4.4.12 - added the 'moving-to-paused' keyword value to the "printer-state-reasons" attribute
5944 for use with the Pause-Job operation.
- 5945 48. Section 4.4.12 - replaced the duplicate 'marker-supply-low' keyword with the missing 'toner-empty'
5946 keyword for the "printer-state-reasons" attribute. (This correction was also made before RFC 2566
5947 was published).
- 5948 49. Section 4.4.12 - clarified 'spool-area-full' "printer-state-reasons" to include non-spooling printers to
5949 indicate when it can and cannot accept another job. [Issue 20](#)
- 5950 50. Section 4.4.15 - added the enum values to the "operations-supported" attribute for the new
5951 operations. Clarified that the values of this attribute are encoded as any enum, namely 32-bit values.
- 5952 51. Section 4.4.30 - clarified that the dateTime value of "printer-current-time" is on a "best efforts
5953 basis". If a proper date-time cannot be obtained, the implementation returns the 'no-value' out-of-
5954 band value. Also clarified that the time zone NEED NOT be the time zone that the people near the
5955 device use and that the client SHOULD display the dateTime attributes in the user's local time.
5956 [Issue 17](#)
- 5957 52. Sections 4.4.36 and 4.4.37 - added the OPTIONAL "pages-per-minute" and "pages-per-minute-
5958 color" Printer Description attributes.
- 5959 53. Section 5.1 - clarified that the client conformance requirements apply to clients controlled by an end
5960 user and clients in servers. [Issue 4](#)
- 5961 54. Section 5.1 - clarified that any response MAY contain additional attribute groups, attributes,
5962 attribute syntaxes, or attribute values. [Issue 25 and Issue 26](#)
- 5963 55. Section 5.1 - clarified that a client SHOULD do its best to prevent a channel from being closed by a
5964 lower layer when the channel is flow controlled off by the IPP Printer. [Issue 4 and Issue 5](#)
- 5965 56. Section 5.2 - clarified that the IPP object requirements apply to objects embedded in devices or that
5966 are parts of servers. [Issue 4](#)

- 5967 57. Section 5.2.2 - clarified that IPP objects MAY return operation responses that contain attribute
5968 groups, attribute names, attribute syntaxes, attribute values, and status codes that are extensions to
5969 this standard. **Issue 26**
- 5970 58. Section 8.3 - clarified the use of URIs for each Client Authentication mechanism.
- 5971 59. Section 8.5 - added the security discussion around the new operator/administrator operations.
- 5972 60. Section 13.1.4.16 - added client-error-compression-not-supported (0x040F) **Issue 6**
- 5973 61. Section 13.1.4.17 - added client-error-compression-error (0x0410) **Issue 6**
- 5974 62. Section 13.1.4.18 - added client-error-document-format-error (0x0411) **Issue 28**
- 5975 63. Section 13.1.4.19 - added client-error-document-access-error (0x0412) **Issue 35**
- 5976 64. Section 13.1.5.10 - added server-error-multiple-document-jobs-not-supported (0x0509) **Issue 34**
- 5977 65. Section 14 - added 'a-white', 'b-white', 'c-white', 'd-white', and 'e-white' and clarified that the existing
5978 'a', 'b', 'c', 'd', and 'e' values are size values.
- 5979 66. Section 16 - added the OPTIONAL "pages-per-minute" and "pages-per-minute-color" Printer
5980 attributes to the Directory schema.
- 5981 67. Section 16 - added OPTIONAL "multiple-document-jobs-supported" to the Directory schema. **Issue**
5982 **34**
- 5983 68. Section 16 - added RECOMMENDED "uri-authentication-supported", "ipp-versions-supported",
5984 and "compression-supported" to the Directory schema. **Issue 2, Issue 36, and Issue 28**

5985 The following changes in semantics and/or conformance have been incorporated into this document:

- 5986 1. Section 3.1.8, 5.2.4, and 13.1.5.4 - Clients and IPP objects MUST support version 1.1 conformance
5987 requirements and SHOULD support version 1.0 conformance requirements. Also clarified that IPP
5988 Printers MUST accept '1.1' requests and SHOULD accept '1.x' requests. **Issue 33 and Issue 36**
- 5989 2. Section 3.2.1.1 and section 4.4.32 - changed the "compression" operation and the "compression-
5990 supported" Printer Description attribute from OPTIONAL to REQUIRED. **Issue 28**
- 5991 3. Sections 3.2.1.2 and 4.3.8 - changed "job-state-reasons" from RECOMMENDED to REQUIRED,
5992 so that "job-state-reasons" MUST be returned in create operation responses. **Issue 30**
- 5993 4. Sections 3.2.4, 3.3.1, 4.4.16, and 16 - changed Create-Job/Send-Document so that they MAY be
5994 implemented while only supporting one document jobs. Added the "multiple-document-jobs-
5995 supported" boolean Printer Description attribute to indicate whether Create-Job/Send-Document
5996 support multiple document jobs or not. Added to the Directory schema. **Issue 34**
- 5997 5. Section 4.1.9 - deleted 'text/plain; charset=iso-10646-ucs-2', since binary is not legal with the 'text'
5998 type.
- 5999 6. Section 4.2.4 - indicated that the "multiple-document-handling" Job Template attribute MUST be
6000 supported with at least one value if the Printer supports multiple documents per job **Issue 34**
- 6001 7. Section 4.3.7.2 - indicated that the 'job-restartable' job state reason SHOULD be supported if the
6002 Restart-Job operation is supported. **Issue 30**
- 6003 8. Section 4.3.8 - changed "job-state-reasons" from RECOMMENDED to REQUIRED. **Issue 30**
- 6004 9. Section 4.3.8 - clarified the conformance of the values of the "job-state-reasons" attribute by
6005 copying conformance requirements from other sections of the document so that it is clear from
6006 reading the definition of "job-state-reasons" which values MUST or SHOULD be supported. The
6007 'none', 'unsupported-compression', and 'unsupported-document-format' values MUST be supported.
6008 The "job-hold-until-specified" SHOULD be specified if the "job-hold-until" Job Template is
6009 supported. The following values SHOULD be supported: 'job-canceled-by-user', 'aborted-by-
6010 system', and 'job-completed-successfully'. The 'job-canceled-by-operator' SHOULD be supported if

- 6011 the implementation permits canceling by other than the job owner. The 'job-canceled-at-device'
6012 SHOULD be supported if the device supports canceling jobs at the console. The 'job-completed-
6013 with-warnings' SHOULD be supported, if the implementation detects warnings. The 'job-
6014 completed-with-errors' SHOULD be supported if the implementation detects errors. The 'job-
6015 restartable' SHOULD be supported if the Restart-Job operation is supported. **Issue 30**
- 6016 10. Section 4.3.14 - changed the "time-at-creation", "time-at-processing", and "time-at-completed"
6017 Event Time Job Description attributes from OPTIONAL to REQUIRED. **Issue 17**
- 6018 11. Section 4.3.14.4 - added the REQUIRED "job-printer-up-time (integer(1:MAX))" Job Description
6019 attribute as an alias for "printer-up-time" to reduce number of operations to get job times. **Issue 17**
- 6020 12. Section 4.4.2 - added the REQUIRED "uri-authentication-supported (1setOf type2 keyword)"
6021 Printer Description attribute to describe the Client Authentication used by each Printer URI. **Issue 2**
- 6022 13. Section 4.4.12 - changed "printer-state-reasons" Printer Description attribute from OPTIONAL to
6023 REQUIRED. **Issue 30**
- 6024 14. Section 4.4.12 - changed 'paused' value of "printer-state-reasons" to MUST if Pause-Printer
6025 operation is supported. **Issue 30**
- 6026 **15.** Section 4.4.14 - added the REQUIRED "ipp-versions-supported (1setOf keyword)" Printer
6027 Description attribute, since IPP/1.1 Printers do not have to support version '1.0' conformance
6028 requirements. **Issue 36**
- 6029 16. Section 4.4.16 - added the "multiple-document-jobs-supported (boolean)" Printer Description
6030 attribute so that a client can tell whether a Printer that supports Create-Job/Send-Document supports
6031 multiple document jobs or not. This attribute is REQUIRED if the Create-Job operation is
6032 supported. **Issue 34**
- 6033 17. Section 4.4.24 - changed the "queued-job-count" Printer Description attribute from
6034 RECOMMENDED to REQUIRED. **Issue 29**
- 6035 18. Section 4.4.32 - changed "compression-supported (1setOf type3 keyword)" Printer Description
6036 attribute from OPTIONAL to REQUIRED. **Issue 28**
- 6037 19. Section 5.1 - changed the client security requirements from RECOMMENDED non-standards track
6038 SSL3 to MUST support Client Authentication as defined in the IPP/1.1 Encoding and Transport
6039 document [IPP-PRO]. A client SHOULD support Operation Privacy and Server Authentication as
6040 defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. **Issue 32**
- 6041 20. Section 5.2.7 - changed the IPP object security requirements from OPTIONAL non-standards track
6042 SSL3 to SHOULD contain support for Client Authentication as defined in the IPP/1.1 Encoding and
6043 Transport document [IPP-PRO]. A Printer implementation MAY allow an administrator to
6044 configure the Printer so that all, some, or none of the users are authenticated. An IPP Printer
6045 implementation SHOULD contain support for Operation Privacy and Server Authentication as
6046 defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation
6047 MAY allow an administrator to configure the degree of support for Operation Privacy and Server
6048 Authentication. Security MUST NOT be compromised when the client supplies a lower version-
6049 number in a request. **Issue 32**

6050 See also the "IPP/1.1 Encoding and Transport" [IPP-PRO] document for differences between IPP/1.0
6051 [RFC2565] and IPP/1.1 [IPP-PRO].
