Internet Printing Protocol/1.0: Protocol Specification draft-ietf-ipp-protocol-02.txt

Status of this Memo

This document is an Internet-Draft. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress".

To learn the current status of any Internet-Draft, please check the "1id-abstracts.txt" listing contained in the Internet-Drafts Shadow Directories on [ftp.is.co.za](ftp://ftp.is.co.za) (Africa), nic.nordu.net (Europe), munnari.oz.au (Pacific Rim), ds.internic.net (US East Coast), or ftp.isi.edu (US West Coast).

Abstract

This document is one of a set of documents, which together describe all aspects of a new Internet Printing Protocol (IPP). IPP is an application level protocol that can be used for distributed printing using Internet tools and technology. The protocol is heavily influenced by the printing model introduced in the Document Printing Application (ISO/IEC 10175 DPA) standard. Although DPA specifies both end user and administrative features, IPP version 1.0 is focused only on end user functionality.

The full set of IPP documents includes:

- Internet Printing Protocol: Requirements
- Internet Printing Protocol/1.0: Model and Semantics
- Internet Printing Protocol/1.0: Security
- Internet Printing Protocol/1.0: Protocol Specification
- Internet Printing Protocol/1.0: Directory Schema

The requirements document takes a broad look at distributed printing functionality, and it enumerates real-life scenarios that help to clarify the features that need to be included in a printing protocol for the Internet. It identifies requirements for three types of users: end users, operators, and administrators. The requirements document calls out a subset of end user requirements that MUST be satisfied in the first version of IPP. Operator and administrator requirements are out of scope for v1.0. The model and semantics document describes a simplified model with abstract objects, their attributes, and their operations. The model introduces a Printer object and a Job object. The Job object supports multiple documents per job. The security document covers potential threats and proposed counters to those threats. The protocol specification is formal document which incorporates the ideas in all the other documents into a concrete mapping using clearly defined data representations and transport protocol mappings that real implementers can use to develop interoperable client and server side components. Finally, the directory schema document shows a generic schema for directory service entries that represent instances of IPP Printers.

This document is the "Internet Printing Protocol/1.0: Protocol Specification" document.

83		

84 1. Introduction

85 This document contains the rules for encoding IPP operations and describes two layers: the transport layer and the operation
86 layer.

87 The transport layer consists of an HTTP/1.1 request or response. RFC 2068 [27] describes HTTP/1.1. This document specifies
88 the HTTP headers that an IPP implementation supports.

89 The operation layer consists of a message body in an HTTP request or response. The document "Internet Printing
90 Protocol/1.0: Model and Semantics" [21] defines the semantics of such a message body and the supported values. This
91 document specifies the encoding of an IPP operation. The aforementioned document [21] is henceforth referred to as the "IPP
92 model document"

93 2. Conformance Terminology

94 The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT",
95 "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [25].

96 3. Encoding of the Operation Layer

97 The operation layer SHALL contain a single operation request or operation response.

98 The encoding consists of octets as the most primitive type. There are several types built from octets, but two important types
99 are integers and characters, on which most other data types are built. Every character in this encoding SHALL be a member of
100 the UCS-2 coded character set and SHALL be encoded using UTF-8 which uses 1 to 3 octets per character. Every integer in
101 this encoding SHALL be encoded as a signed integer using two's-complement binary encoding with big-endian format (also
102 known as "network order" and "most significant byte first"). The number of octets for an integer SHALL be 1, 2 or 4,
103 depending on usage in the protocol. Such one-octet integers, henceforth called SIGNED-BYTE, are used for the version and
104 tag fields. Such two-byte integers, henceforth called SIGNED-SHORT are used for the operation, status-code and length fields.
105 Four byte integers, henceforth called SIGNED-INTEGER, are used for values fields.

106 The following two sections present the operation layer in two ways

- 107 • informally through pictures and description
108 • formally through Augmented Backus-Naur Form (ABNF), as specified by draft-ietf-drums-abnf-02.txt [29]

109 3.1 Picture of the Encoding

110 The encoding for an operation request or response consists of:

111	-----		
112		version	2 bytes - required
113	-----		
114	operation (request) or status-code (response)	2 bytes	- required
115	-----		
116	+ parameter tag	1 byte	
117	-----		optional
118	+ parameter sequence	m bytes	
119	-----		
120	attribute-tag	1 byte	
121	-----		-0 or more
122	attribute-sequence	n bytes	
123	-----		
124	data-tag	1 byte	- required
125	-----		
126	data	q bytes	- optional
127	-----		

128 The parameter tag and parameter sequence may be omitted if the operation has no parameters. The attribute-tag and attribute-
 129 sequence may be omitted if the operation has no attributes or it may be replicated in special cases, such as for an operation that
 130 contains attributes for multiple objects. The data is omitted from some operations, but the data-tag is present even when the
 131 data is omitted. Note, the parameter tag, attribute-tag and data-tag are called ‘delimiter-tags’.

132 A parameter sequence consists of a sequence of zero or more compound parameters.

133	-----		
134	+ compound parameter	r bytes	0 or more
135	-----		

136 An attributes-sequence consists of zero or more compound-attributes.

137	-----		
138	compound-attribute	s bytes	- 0 or more
139	-----		

140 A compound parameter consists of a parameter with a single value optionally followed by zero or more additional values. A
 141 compound-attribute consists an attribute with a single value followed by zero or more additional values.

142 Each parameter or attribute consists of:

143	-----		
144	value-tag	1 byte	
145	-----		
146	name-length (value is u)	2 bytes	
147	-----		
148	name	u bytes	
149	-----		
150	value-length (value is v)	2 bytes	
151	-----		
152	value	v bytes	
153	-----		

154 An additional value consists of:

155	value-tag	1 byte	
156	name-length (value is 0x0000)	2 bytes	-0 or more
157	value-length (value is w)	2 bytes	
158	value	w bytes	

164 | Note: an additional value is like an parameter or attribute whose name-length is 0.

166 From the standpoint of a parsing loop, the encoding consists of:

167	version	2 bytes	- required
168	operation (request) or status-code (response)	2 bytes	- required
169	tag (delimiter-tag or value-tag)	1 byte	-0 or more
170	empty or rest of attribute	x bytes	
171	data-tag	2 bytes	- required
172	data	y bytes	- optional

181 The value of the tag determines whether the bytes following the tag are:

- 182 | • parameters
- 183 | • attributes
- 184 | • data
- 185 | • the remainder of a single parameter or attribute where the tag specifies the type of the value.

186 3.2 Syntax of Encoding

187 The syntax below is ABNF except ‘strings of literals’ SHALL be case sensitive. For example ‘a’ means lower case ‘a’ and not
188 upper case ‘A’. In addition, SIGNED-BYTE and SIGNED-SHORT fields are represented as ‘%x’ values which show their
189 range of values.

```

190    ipp-message = ipp-request / ipp-response
191    ipp-request = version operation
192    |   [parameter-tag parameter-sequence]
193    |     *(attribute-tag attribute-sequence) data-tag data
194    ipp-response = version status-code
195    |   [parameter-tag parameter-sequence]
196    |     *(attribute-tag attribute-sequence) data-tag data
197
198    version = major-version minor-version
199    major-version = SIGNED-BYTE ; initially %d1
200    minor-version = SIGNED-BYTE ; initially %d0

```

```

201
202     operation = SIGNED-SHORT ; mapping from model defined below
203     status-code = SIGNED-SHORT ; mapping from model defined below
204
205     parameter-sequence = *compound-parameter
206     attribute-sequence = *compound-attribute
207     compound-parameter = parameter *additional-values
208     compound-attribute = attribute *additional-values
209
210     parameter = value tag name-length name value-length value
211     attribute = value-tag name-length name value-length value
212     additional-values = value-tag zero-name-length value-length value
213
214     name-length = SIGNED-SHORT ; number of octets of 'name'
215     name = LALPHA *(LALPHA / DIGIT / "-" / "_" / ".")
216     value-length = SIGNED-SHORT ; number of octets of 'value'
217     value = OCTET-STRING
218
219     data = OCTET-STRING
220
221     zero-name-length = %x00.00 ; name-length of 0
222     parameter tag = %x01 ; tag of 1
223     attribute-tag = %x02 ; tag of 2
224     data-tag = %x03 ; tag of 3
225     value-tag = %x10-FF
226
227     SIGNED-BYTE = BYTE
228     SIGNED-SHORT = 2BYTE
229     DIGIT = %x30-39 ; "0" to "9"
230     LALPHA = %x61-7A ; "a" to "z"
231     BYTE = %x00-FF
232     OCTET-STRING = *BYTE
233

```

234 The syntax allows an attributeparameter-tag to be present when the attributeparameter-sequence that follows is empty. The
 235 same is true for the attribute tag and the attribute sequence that follows. The syntax is defined this way to allow for the
 236 response of Get-Jobs where no attributes are returned for some job-objects. Although it is RECOMMENDED that the sender
 237 not send a parameter tag if there are no parameters and not send an attribute-tag if there are no attributes (except in the Get-
 238 Jobs response just mentioned), the receiver MUST be able to decode such syntax.

239 3.3 Version

240 The version SHALL consist of a major and minor version, each of which SHALL be represented by a SIGNED-BYTE. The
 241 protocol described in this document SHALL have a major version of 1 (0x01) and a minor version of 0 (0x00). The ABNF for
 242 these two bytes SHALL be %x01.00.

243 3.4 Mapping of Operations

244 Operations are defined as enums in the model document. An operations enum value SHALL be encoded as a SIGNED-SHORT
 245 Note: the values 0x4000 to 0xFFFF are reserved for private extensions. The following SHALL be the mapping of operations
names to integer values which are encoded as a SIGNED-SHORT. The operations are defined in the IPP model document. The

247 table below includes a range of values for future extensions to the protocol and a separate range for private extensions. It is
 248 RECOMMENDED that the private extension values be used for temporary experimental implementations and not for deployed
 249 products.

Encoding (hex)	Operation
0x0	reserved (not used)
0x1	Get-Operations
0x2	Print-Job
0x3	Print-URI
0x4	Validate-Job
0x5	Create-Job
0x6	Send-Document
0x7	Send-URI
0x8	Cancel-Job
0x9	Get-Attributes
0xA	Get-Jobs
0xB-0x3FFF	reserved for future operations
0x4000-0xFFFF	reserved for private extensions

250 3.5 Mapping of Status-code

251 Status-codes are defined as enums in the model document. A status-code enum value SHALL be encoded as a SIGNED-
 252 SHORT

253 The following SHALL be the mapping of status code names to integer values which are encoded as a SIGNED SHORT. The
 254 status code names are defined in the IPP model document.

255 If an IPP status-code is returned, then the HTTP Status-Code MUST be 200 (OK). With any other HTTP Status-Code value, the
 256 HTTP response SHALL NOT contain an IPP message-body, and thus no IPP status-code is returned.

257 Note: the integer encodings below were chosen to be similar to corresponding Status Code values in HTTP. The IPP client and
 258 server errors have the same relative offset to their base as corresponding HTTP errors, but the IPP base is a multiple of 0x100
 259 whereas the HTTP base is a multiple of 100. Despite this similarity, the Status Code returned at the HTTP level will always be
 260 different except in the case where 'OK' is returned at both levels, 200 (OK) in HTTP and 0 (successful OK) in IPP.

261 Note: some status code values, such as client error unauthorized, may be returned at the transport (HTTP) level rather than the
 262 operation level.

263 ISSUE: as implementations proceed, we will learn what error code need to be supported at the IPP level.

Encoding (hex)	Status-Code Name
0	successful-OK
0x400	client-error-bad-request
0x401	client-error-unauthorized
0x403	client-error-forbidden
0x404	client-error-not-found
0x405	client-error-method-not-allowed
0x408	client-error-timeout
0x40A	client-error-gone
0x40D	client-error-request-entity-too-large
0x40E	client-error-request-URI-too-long

Encoding (hex)	Status-Code Name
0x40F	client-error-unsupported-document-format
0x410	client-error-attribute-not-supported
0x500	server-error-internal-server-error
0x501	server-error-operation-not-implemented
0x503	server-error-service-unavailable
0x504	server-error-timeout
0x505	server-error-version-not-supported
0x506	server-error-printer-error
0x507	server-error-temporary-error

264 3.6 Tags

265 There are two kinds of tags:

- 266 • delimiter tags: delimit major sections of the protocol, namely parameters, attributes and data
- 267 • value tags: specify the type of each parameter or attribute value

268 3.6.1 Delimiter Tags

269 The following table specifies the values for the delimiter tags:

Tag Value (Hex)	Delimiter
0x00	reserved
0x01	<u>reserved-parameter tag</u>
0x02	attribute-tag
0x03	data-tag
0x04-0x0F	reserved for future delimiters

270 3.6.2 Value Tags

271 The remaining tables show values for the value-tag, which is the first octet of an parameter or attribute. The value-tag specifies 272 the type of the value of the parameter or attribute. The value of the value-tag of an parameter or attribute SHALL either be a 273 type value specified in the model document or an “out-of-band” value, such as “unsupported” or “default”. If the value of 274 value-tag for an attribute or parameter is not “out-of-band” and differs from the value type specified by the model document, 275 then a server receiving such a request MAY reject it, and a client receiving such a response MAY ignore the attribute or 276 parameter.

277 The following table specifies the “out-of-band” values for the value-tag.

Tag Value (Hex)	Meaning
0x10	unsupported
0x11	default
0x12	no-value
0x13-0x1F	reserved for future “out-of-band” values.

278 The “unsupported” value SHALL be used in the attribute-sequence of an error response for those attributes which the server 279 does not support. The “default” value is reserved for future use of setting value back to their default value. The “no-value” value

280 is used for the “no-value” value in model, e.g. when a document-attribute is returned as a set of values and an attribute has no
 281 specified value for one or more of the documents.

282 The following table specifies the integer values for the value-tag

Tag Value (Hex)	Meaning
0x20	reserved
0x21	integer
0x22	boolean
0x23	enum
0x24-0x2F	reserved for future integer types

283 NOTE: 0x20 is reserved for “generic integer” if should ever be needed.

284 The following table specifies the octet-string values for the value-tag

Tag Value (Hex)	Meaning
0x30	reserved
0x31	dateTime
0x32	resolution
0x33-0x3F	reserved for future octet-string types

285 The following table specifies the character-string values for the value-tag

Tag Value (Hex)	Meaning
0x40	reserved
0x41	text
0x42	name
0x43	language
0x44	keyword
0x45	uri
0x46	uriScheme
0x47-0x5F	reserved for future character string types

286 NOTE: 0x40 is reserved for “generic character-string” if should ever be needed.

287 The values 0x60-0xFF are reserved for future types. There are no values allocated for private extensions. A new type must be
 288 registered via the type 2 process.

289 | ~~Issue: should this be a type 1 process.~~

290 3.7 Name-Lengths

291 The name-length field SHALL consist of a SIGNED-SHORT. This field SHALL specify the number of octets in the name field
 292 which follows the name-length field, excluding the two bytes of the name-length field.

293 If a name-length field has a value of zero, the following name field SHALL be empty, and the following value SHALL be
 294 treated as an additional value for the preceding ~~attribute parameter~~. ~~Within a parameter sequence, if two parameters have the~~

295 same name, the first occurrence SHALL be ignored. Within an attribute-sequence, if two attributes have the same name, the
296 first occurrence SHALL be ignored. The zero-length name is the only mechanism for multi-valued ~~parameters and~~ attributes.

297 3.8 Mapping of Attribute Parameter Names

298 Some ~~attributes~~parameters are encoded in a special position. These ~~attribute~~parameters are:

- 299 • “printer-uri”: The printer-uri of each ~~printer~~ object operation in the IPP model document SHALL be specified both as
300 a parameter named “~~printer~~ uri” in the operation layer, and outside of the operation layer as the request-URI on the
301 Request-Line at the HTTP level.
- 302 • “job uri”: The job uri of each job object operation in the IPP model document SHALL be specified both as a
303 parameter named “~~job~~ uri” in the operation layer, and outside of the operation layer as the request URI on the
304 Request Line at the HTTP level.
- 305 •
- 306 • “document-content”: The ~~attribute~~parameter named “document-content” in the IPP model document SHALL become
307 the “data” in the operation layer.
- 308 • “status-code”: The ~~attribute~~parameter named “status-code” in the IPP model document SHALL become the “status-
309 code” field in the operation layer response.

310 The remaining attributes defined in the model document represent either a specific attribute or a collection of attributes. These
311 attributes SHALL be encoded in the attribute-sequence according to the order specified in the model document. If an attribute
312 in the model document represents a collection of object attributes, those attributes are encoded as a sequence of attributes in the
313 position specified by the model document, but the attributes in this collection may be in any order.

314 The remaining parameters are encoded in the parameter sequence or the attribute sequence. The parameter sequence is for
315 actual operation parameters and the attribute sequence is for object attributes. Of the parameters defined in the IPP model
316 document, some represent an actual operation parameters and others represent a collection of object attributes.

317 A parameter in the IPP model document SHALL represent a collection of object attributes if its name contains the word
318 “~~attributes~~” immediately preceded by a space; otherwise it SHALL represent an actual operation parameter. Note, some actual
319 operation parameters contain the word “~~attributes~~” preceded by a hyphen (“-”). They are not a collection of attributes: ISSUE:
320 coordinate this with the model document.

321 If a parameter in IPP model document represents an actual operation parameter and is not in a special position, it SHALL be
322 encoded in the parameter sequence using the text name of the parameter specified in the IPP model document.

323 If a parameter in IPP model document represents a collection of object attributes, the attributes SHALL be encoded in the
324 attribute sequence using the text names of the attributes specified in the IPP model document. The IPP model document
325 specifies the members of such attribute collections, but does not require that all members of a collection be present in an
326 operation.

327 If a response contains unsupported attributes, these attributes SHALL be in a second attribute-sequence. Otherwise, if an
328 operation contain attributes from exactly one object, there SHALL be exactly one attribute-sequence. If an operation contains
329 attributes from more than one object (e.g. Get-Jobs response), the attributes from each object SHALL be in a separate attribute-
330 sequence, such that the attributes from the ith object are in the ith attribute-sequence.

331 See Section 10 “Appendix B: Mapping of Each Operation in the Encoding” for table showing the application of the rules
332 above.

333 3.9 Value Lengths

- 334 | Each attributeparameter value SHALL be preceded by a SIGNED-SHORT which SHALL specify the number of octets in the
 335 value which follows this length, exclusive of the two bytes specifying the length.
- 336 For any of the types represented by binary signed integers, the sender MUST encode the value in exactly four octets..
- 337 For any of the types represented by character-strings, the sender MUST encode the value with all the characters of the string
 338 and without any padding characters.
- 339 If a value-tag contains an “out-of-band” value, such as “unsupported”, the value-length SHALL be 0 and the value empty —
 340 the value has no meaning when the value-tag has an “out-of-band” value. If a server or client receives an operation with a
 341 nonzero value-length in this case, it SHALL ignore the value field.

342 3.10 Mapping of Attribute and Parameter Values

- 343 | The following SHALL be the mapping of attribute and parameter values to their IPP encoding in the value field. The syntax
 344 types are defined in the IPP model document.

Syntax of Attribute Value	Encoding
text	an octet string where each character is a member of the UCS-2 coded character set and is encoded using UTF-8. The text is encoded in “network byte order” with the first character in the text (according to reading order) being the first character in the encoding.
name	same as text
language	same as text but with a syntax specified by RFC 1766
keyword	same as text. Allowed text values are defined in the IPP model document
uri	same as text
uriScheme	same as text
boolean	one binary octet where 0x00 is ‘false’ and 0x01 is ‘true’
integer	a SIGNED-INTEGER, defined previously as a signed integer using two’s-complement binary encoding in four octets with big-endian format (also known as “network order” and “most significant byte first”).
enum	same as integer. Allowed integer values are defined in the IPP model document
dateTime	eleven octets whose contents are defined by “DateAndTime” in RFC 1903. Although RFC 1903 also defines an eight octet format which omits the time zone, a value of this type in the IPP protocol MUST use the eleven octet format.
resolution	nine octets consisting of 2 SIGNED-INTEGERs followed by a SIGNED-BYTE. The values are the same as those specified in draft-ietf-printmib-mib-info-02.txt [30]. The first SIGNED-INTEGER contains the value of prtMarkerAddressabilityXFeedDir. The second SIGNED-INTEGER contains the value of prtMarkerAddressabilityFeedDir. The SIGNED-BYTE contains the value of prtMarkerAddressabilityUnit. Note: the latter value is either 3 (tenThousandsOfInches) or 4 (micrometers) and the addressability is in 10,000 units of measure. Thus the SIGNED-INTEGERS represent integral values in either dots-per-inch or dots-per-centimeter.
1setOf X	encoding according to the rules for an <u>attributeparameter</u> with more than one value.
rangeOf X	Each value X is encoded according to the rules for encoding its type. same 1setOf X where the number of values is 2.

- 345 The type of the value in the model document determines the encoding in the value and the value of the value-tag.

346 **3.11 Data**

347 The data part SHALL include any data required by the operation

348 **4. Encoding of Transport Layer**

349 HTTP/1.1 shall be the transport layer for this protocol.

350 The operation layer has been designed with the assumption that the transport layer contains the following information:

- 351 • the URI of the target job or printer operation
352 • the total length of the data in the operation layer, either as a single length or as a sequence of chunks each with a
353 length.
354 • the client's language, the character-set and the transport encoding.

355 Each HTTP operation shall use the POST method where the request-URI is the object target of the operation, and where the
356 “Content-Type” of the message-body in each request and response shall be “application/ipp”. The message-body shall contain
357 the operation layer and shall have the syntax described in section 3.2 “Syntax of Encoding”. A client implementation SHALL
358 adhere to the rules for a client described in RFC 2068. A server implementation SHALL adhere the rules for an origin server
359 described in RFC 2068. In the following sections, there are tables of all HTTP headers which describe their use in an IPP
360 client or server. The following is an explanation of each column in these tables.

- 361 • the “header” column contains the name of a header
362 • the “request/client” column indicates whether a client sends the header.
363 • the “request/server” column indicates whether a server supports the header when received.
364 • the “response/server” column indicates whether a server sends the header.
365 • the “response /client” column indicates whether a client supports the header when received.
366 • the “values and conditions” column specifies the allowed header values and the conditions for the header to be present
367 in a request/response.

368 The table for “request headers” does not have columns for responses, and the table for “response headers” does not have
369 columns for requests.

370 The following is an explanation of the values in the “request/client” and “response/server” columns.

- 371 • **must:** the client or server MUST send the header,
372 • **must-if:** the client or server MUST send the header when the condition described in the “values and conditions”
373 column is met,
374 • **may:** the client or server MAY send the header
375 • **not:** the client or server SHOULD NOT send the header. It is not relevant to an IPP implementation.

376 The following is an explanation of the values in the “response/client” and “request/server” columns.

- 377 • **must:** the client or server MUST support the header,
378 • **may:** the client or server MAY support the header
379 • **not:** the client or server SHOULD NOT support the header. It is not relevant to an IPP implementation.

380 **4.1 General Headers**

381 The following is a table for the general headers.

382 ISSUE: an HTTP expert should review these tables for accuracy.

General-Header	Request		Response		Values and Conditions
	Client	Server	Server	Client	
Cache-Control	must	not	must	not	“no-cache” only
Connection	must-if	must	must-if	must	“close” only. Both client and server SHOULD keep a connection for the duration of a sequence of operations. The client and server MUST include this header for the last operation in such a sequence.
Date	may	may	must	may	per RFC 1123 [9]
Pragma	must	not	must	not	“no-cache” only
Transfer-Encoding	must-if	must	must-if	must	“chunked” only . Header MUST be present if Content-Length is absent.
Upgrade	not	not	not	not	
Via	not	not	not	not	

383

384 4.2 Request Headers

385 The following is a table for the request headers.

386

Request-Header	Client	Server	Request Values and Conditions
Accept	may	must	“application/ipp” only. This value is the default if the client omits it
Accept-Charset	may	must	per IANA Character Set registry. ISSUE: is this useful for IPP?
Accept-Encoding	may	must	empty and per RFC 2068 [27] and IANA registry for content-codings
Accept-Language	may	must	see RFC 1766 [26]. A server SHOULD honor language requested by returning the values status-message, job-state-message and printer-state-reason in one of requested languages.
Authorization	must-if	must	per RFC 2068. A client MUST send this header when it receives a 401 “Unauthorized” response and does not receive a “Proxy-Authenticate” header.
From	not	not	per RFC 2068. Because RFC recommends sending this header only with the user’s approval, it is not very useful
Host	must	must	per RFC 2068
If-Match	not	not	
If-Modified-Since	not	not	
If-None-Match	not	not	
If-Range	not	not	
If-Unmodified-Since	not	not	
Max-Forwards	not	not	
Proxy-Authorization	must-if	not	per RFC 2068. A client MUST send this header when it receives a 401 “Unauthorized” response and a “Proxy-Authenticate” header.
Range	not	not	

Request-Header	Client	Server	Request Values and Conditions
Referer	not	not	
User-Agent	not	not	

387 **4.3 Response Headers**

388 The following is a table for the request headers.

389

Response-Header	Server	Client	Response Values and Conditions
Accept-Ranges	not	not	
Age	not	not	
Location	must-if	may	per RFC 2068. When URI needs redirection.
Proxy-Authenticate	not	must	per RFC 2068
Public	may	may	per RFC 2068
Retry-After	may	may	per RFC 2068
Server	not	not	
Vary	not	not	
Warning	may	may	per RFC 2068
WWW-Authenticate	must-if	must	per RFC 2068. When a server needs to authenticate a client.

390 **4.4 Entity Headers**

391 The following is a table for the entity headers.

392

Entity-Header	Request		Response		Values and Conditions
	Client	Server	Server	Client	
Allow	not	not	not	not	
Content-Base	not	not	not	not	
Content-Encoding	may	must	must	must	per RFC 2068 and IANA registry for content codings.
Content-Language	may	must	must	must	see RFC 1766 [26].
Content-Length	must-if	must	must-if	must	the length of the message-body per RFC 2068. Header MUST be present if Transfer-Encoding is absent..
Content-Location	not	not	not	not	
Content-MD5	may	may	may	may	per RFC 2068
Content-Range	not	not	not	not	
Content-Type	must	must	must	must	“application/ipp” only
ETag	not	not	not	not	
Expires	not	not	not	not	
Last-Modified	not	not	not	not	

393 **5. Security Considerations**

394 When utilizing HTTP 1.1 as a transport of IPP, the security considerations outlined in RFC 2068 apply. Specifically, IPP
 395 servers can generate a 401 "Unauthorized" response code to request client authentication and IPP clients should correctly
 396 respond with the proper "Authorization" header. Both Basic Authentication (RFC 2068) and Digest Authentication (RFC
 397 2069) flavors of authentication should be supported. The server chooses which type(s) of authentication to accept. Digest
 398 Authentication is a more secure method, and is always preferred to Basic Authentication.

399 For secure communication (privacy in particular), IPP should be run using a secure communications channel. Both Transport
400 Layer Security - TLS (draft-ietf-tls-protocol-03) and IPSec (RFC 1825) provide necessary features for security. It is possible to
401 combine the two techniques, HTTP 1.1 client authentication (either basic or digest) with secure communications channel
402 (either TLS or IPSec). Together the two are more secure than client authentication and they perform user authentication.

403 Complete discussion of IPP security considerations can be found in the IPP Security document

404 ISSUE: how does each security mechanism supply the job-originating-user and job-originating-host values?

434 9. Appendix A: Protocol Examples

435 9.1 Print-Job Request

436 The following is an example of a Print-Job request with job-name, copies, and sides specified.

Octets	Symbolic Value	Protocol field
0x0100	1.0	version
0x0002	PrintJob	operation
0x02	start attributes	attribute tag
0x42	name type	value-tag
0x0008		name-length
job-name	job-name	name
0x0006		value-length
foobar	foobar	value
0x21	integer type	value-tag
0x0005		name-length
copies	copies	name
0x0004		value-length
0x00000014	20	value
0x44	keyword type	value-tag
0x0005		name-length
sides	sides	name
0x001304		value-length
two-sided-long-edge	two-sided-long-edge	value
0x03	start-data	data-tag
%!PS...	<PostScript>	data

437 9.2 Print-Job Response (successful)

438 Here is an example of a Print-Job response which is successful:

Octets	Symbolic Value	Protocol field
0x0100	1.0	version
0x0000	OK (successful)	status-code
0x024	start <u>attributes</u> <u>parameters</u>	<u>attribute</u> <u>parameter</u> tag
0x41	text type	value-tag
0x000E		name-length
status-message	status-message	name
0x0002		value-length
OK	OK	value
0x2145	<u>integer</u> <u>uri</u> type	value-tag
0x00078		name-length
job- <u>id</u> <u>uri</u>	job- <u>id</u> <u>uri</u>	name

Octets	Symbolic Value	Protocol field
0x0004E		value-length
<u>147</u>	<u>147</u>	<u>value</u>
0x25	name type	value-tag
0x0008		name-length
job-state	job-state	name
0x0001		value-length
0x03	pending	value
0x03	start-data	data-tag

439 9.3 Print-Job Response (failure)

440 Here is an example of a Print-Job response which fails because the printer does not support sides and because the value 20 for
 441 copies is not supported:

Octets	Symbolic Value	Protocol field
0x0100	1.0	version
0x0400	client-error-bad-request	status-code
0x024	start <u>atributesparameters</u>	<u>attributeparameter</u> tag
0x41	text type	value-tag
0x000E		name-length
status-message	status-message	name
0x000D		value-length
bad-request	bad-request	value
0x02	start attributes	attribute tag
0x21	integer type	value-tag
0x0005		name-length
copies	copies	name
0x0004		value-length
0x00000014	20	value
0x10	unsupported (type)	value-tag
0x0005		name-length
sides	sides	name
0x0000		value-length
0x03	start-data	data-tag

442 9.4 Print-URI Request

443 The following is an example of Print-URI request with copies and job-name parameters.

Octets	Symbolic Value	Protocol field
0x0100	1.0	version
0x0003	Print-URI	operation
0x024	start- <u>atributesparameters</u>	<u>attributeparameter</u> tag
0x45	uri type	value-tag
0x000A		name-length
document-uri	document-uri	name
0x11		value-length
ftp://foo.com/foo	ftp://foo.com/foo	value
0x42		value-tag
0x0008		name-length

Octets	Symbolic Value	Protocol field
job-name	job-name	name
0x0006		value-length
foobar	foobar	value
0x21	integer type	value-tag
0x0005		name-length
copies	copies	name
0x0004		value-length
0x00000001	1	value
0x03	start-data	data-tag
% !PS...	<PostScript>	data

444 9.5 Create-Job Request

445 The following is an example of Create-Job request with no parameters and no attributes

Octets	Symbolic Value	Protocol field
0x0100	1.0	version
0x0005	Create-Job	operation
0x03	start-data	data-tag

446 9.6 Get-Jobs Request

447 The following is an example of Get-Jobs request with parameters but no attributes.

Octets	Symbolic Value	Protocol field
0x0100	1.0	version
0x000A	Get-Jobs	operation
0x024	start-attributesparameters	attribute-parameter-tag
0x21	integer type	value-tag
0x0005		name-length
limit	limit	name
0x0004		value-length
0x00000032	50	value
0x44	keyword type	value-tag
0x0014		name-length
requested-attributes	requested-attributes	name
0x00067		value-length
job-iduri	job-iduri	value
0x44	keyword type	value-tag
0x0000	additional value	name-length
0x0008		value-length
job-name	job-name	value
0x03	start-data	data-tag

448 9.7 Get-Jobs Response

449 The following is an of Get-Jobs response from previous request with 3 jobs. The Printer returns no information about the
450 second job.

Octets	Symbolic Value	Protocol field
0x0100	1.0	version
0x0000	OK (successful)	status-code

Octets	Symbolic Value	Protocol field
0x024	start-attributesparameters	attributeparameter-tag
0x41	text type	value-tag
0x000E		name-length
status-message	status-message	name
0x0002		value-length
OK	OK	value
0x02	start-attributes (1st object)	attribute-tag
0x2145	integeruri type	value-tag
0x00067		name-length
job-iduri	job-iduri	name
0x0004E		value-length
147http://foo/123	147http://foo/123	value
0x42	name type	value-tag
0x0008		name-length
job-name	job-name	name
0x0003		name-length
foo	foo	name
0x02	start-attributes (2nd object)	attribute-tag
0x02	start-attributes (3rd object)	attribute-tag
0x2145	intergeruri type	value-tag
0x00067		name-length
job-iduri	job-iduri	name
0x0004E		value-length
148http://foo/124	148http://foo/124	value
0x42	name type	value-tag
0x0008		name-length
job-name	job-name	name
0x0003		name-length
bar	bar	name
0x03	start-data	data-tag

451 10. Appendix B: Mapping of Each Operation in the Encoding

452 The next three tables show the results of applying the rules above to the operations defined in the IPP model document. There is
 453 no information in these tables that cannot be derived from the rules presented in Section 3.8 “Mapping of Attribute Parameter
 454 Names”.

455 The following table shows the mapping of all IPP model document request attributesparameters to an parameter sequence,
 456 attribute-sequence or special position in the protocol. A request contains at most one attribute sequence.

Operation	<u>attribute sequence</u>	<u>special position</u>
Get-Operations	printer-uri	
Print-Job	printer-uri best-effort job-name <u>job-template attributes</u> <u>document attributes</u>	document-content
Print-URI	printer-uri best-effort job-name document-uri	

Operation	attribute sequence	special position
	<u>job-template attributes</u> <u>document attributes</u>	
Validate-Job or Create-Job	printer-uri best-effort job-name <u>job-template attributes</u>	
Send-Document	job- <u>iduri</u> last-document <u>document attributes</u>	document-content
Send-URI	job- <u>iduri</u> last-document document-uri <u>document attributes</u>	
Cancel-Job	job- <u>iduri</u> message	
Get-Attributes (for a Printer)	printer-uri document-format requested-attributes	
Get-Attributes (for a Job)	job-uri document-format requested-attributes	
Get-Jobs	printer-uri limit requested-attributes	

457 The following table shows the mapping of all IPP model document response attribute parameters to a parameter sequence, 1st
 458 attribute-sequence, other attribute sequences or special position in the protocol.

Operation	1st attribute-sequence	other attribute-sequences	special position
Get-Operations	status-message supported-operations		status-code
Print-Job, Print-URI or Create-Job	status-message job- <u>iduri</u> <u>job-status attributes</u>	<u>job-status attributes</u>	status-code
Send-Document or Send-URI	status-message <u>job-status attributes</u>	<u>job-status attributes</u>	status-code
Validate-Job	status-message		status-code
Cancel-Job	status-message		status-code
Get-Attributes	status-message <u>requested attributes</u>	<u>requested attributes</u>	status-code
Get-Jobs	status-message	requested attributes (see the Note below)	status-code

459 Note for Get-Jobs: there is a separate attribute-sequence containing requested-attributes for each job object in the response

460 The following table shows the mapping of all IPP model document error response attributeparameters to an parameter-
461 sequence, 1st attribute-sequence, 2nd attribute sequence or special position in the protocol. Those operations omitted don't have
462 special attributeparameters for an error return.

Operation	1st attribute-sequence	2nd attribute-sequence	special position
Print-Job, Print-URI, Validate-Job, Create-Job, Send-Document or Send- URI	status-message	unsupported attributes	status-code

463
