14 Internet Printing Protocol/1.1: Encoding and Transport

17 Status of this Memo

18 This document specifies an Internet standards track protocol for the Internet community, and requests discussion and
19 suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the
20 standardization state and status of this protocol. Distribution of this memo is unlimited.

23 Abstract

24 This document is one of a set of documents, which together describe all aspects of a new Internet Printing Protocol (IPP). IPP is
25 an application level protocol that can be used for distributed printing using Internet tools and technologies. This document
26 defines the rules for encoding IPP operations and IPP attributes into a new Internet mime media type called "application/ipp".
27 This document also defines the rules for transporting over HTTP a message body whose Content-Type is "application/ipp". This
28 document defines a new scheme named 'ipp' for identifying IPP printers and jobs.
29

29 The full set of IPP documents includes:

- 30 Design Goals for an Internet Printing Protocol [RFC2567]
- 31 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]
- 32 Internet Printing Protocol/1.1: Model and Semantics [RFC2911]
- 33 Internet Printing Protocol/1.1: Encoding and Transport (this document)
- 34 Internet Printing Protocol/1.1: Implementer's Guide [ipp-iig]
- 35 Mapping between LPD and IPP Protocols [RFC2569]

36 The document, "Design Goals for an Internet Printing Protocol", takes a broad look at distributed printing functionality, and it
37 enumerates real-life scenarios that help to clarify the features that need to be included in a printing protocol for the Internet. It
38 identifies requirements for three types of users: end users, operators, and administrators. It calls out a subset of end user
39 requirements that are satisfied in IPP/1.1. A few OPTIONAL operator operations have been added to IPP/1.1.

40 The document, "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol", describes IPP from a high
41 level view, defines a roadmap for the various documents that form the suite of IPP specification documents, and gives
42 background and rationale for the IETF working group's major decisions.

43 The document, "Internet Printing Protocol/1.1: Model and Semantics", describes a simplified model with abstract objects, their
44 attributes, and their operations that are independent of encoding and transport. It introduces a Printer and a Job object. The Job
45 object optionally supports multiple documents per Job. It also addresses security, internationalization, and directory issues.

46 The document "Internet Printing Protocol/1.1: Implementer's Guide", gives advice to implementers of IPP clients and IPP objects.

47 The document "Mapping between LPD and IPP Protocols" gives some advice to implementers of gateways between IPP and LPD
48 (Line Printer Daemon) implementations.

103

104 **1. Introduction**

105 This document contains the rules for encoding IPP operations and describes two layers: the transport layer and the operation
106 layer.

107 The transport layer consists of an HTTP/1.1 request or response. RFC 2616 [RFC2616] describes HTTP/1.1. This document
108 specifies the HTTP headers that an IPP implementation supports.

109 The operation layer consists of a message body in an HTTP request or response. The document "Internet Printing Protocol/1.1:
110 Model and Semantics" [ipp-mod] defines the semantics of such a message body and the supported values. This document
111 specifies the encoding of an IPP operation. The aforementioned document [ipp-mod] is henceforth referred to as the "IPP model
112 document" or simply "model document."

113 Note: the version number of IPP (1.1) and HTTP (1.1) are not linked. They both just happen to be 1.1.

114 **2. Conformance Terminology**

115 The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and
116 "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

117 **3. Encoding of the Operation Layer**

118 The operation layer is the message body part of the HTTP request or response and it **MUST** contain a single IPP operation
119 request or IPP operation response. Each request or response consists of a sequence of values and attribute groups. Attribute
120 groups consist of a sequence of attributes each of which is a name and value. Names and values are ultimately sequences of
121 octets.

122 The encoding consists of octets as the most primitive type. There are several types built from octets, but three important types
123 are integers, character strings and octet strings, on which most other data types are built. Every character string in this encoding
124 **MUST** be a sequence of characters where the characters are associated with some charset and some natural language. A
125 character string **MUST** be in "reading order" with the first character in the value (according to reading order) being the first
126 character in the encoding. A character string whose associated charset is US-ASCII whose associated natural language is US
127 English is henceforth called a US-ASCII-STRING. A character string whose associated charset and natural language are specified
128 in a request or response as described in the model document is henceforth called a LOCALIZED-STRING. An octet string **MUST**
129 be in "IPP model document order" with the first octet in the value (according to the IPP model document order) being the first
130 octet in the encoding. Every integer in this encoding **MUST** be encoded as a signed integer using two's-complement binary
131 encoding with big-endian format (also known as "network order" and "most significant byte first"). The number of octets for an
132 integer **MUST** be 1, 2 or 4, depending on usage in the protocol. Such one-octet integers, henceforth called SIGNED-BYTE, are
133 used for the version-number and tag fields. Such two-byte integers, henceforth called SIGNED-SHORT are used for the operation-
134 id, status-code and length fields. Four byte integers, henceforth called SIGNED-INTEGER, are used for value fields and the
135 request-id.

136 The following two sections present the encoding of the operation layer in two ways:

- 137 - informally through pictures and description
- 138 - formally through Augmented Backus-Naur Form (ABNF), as specified by RFC 2234 [RFC2234]

139

140 An operation request or response MUST use the encoding described in these two sections.

141 3.1 Picture of the Encoding

142 3.1.1 Request and Response

143 An operation request or response is encoded as follows:

144	-----	
145	version-number	2 bytes - required
146	-----	
147	operation-id (request)	2 bytes - required
148	or	
149	status-code (response)	
150	-----	
151	request-id	4 bytes - required
152	-----	
153	attribute-group	n bytes - 0 or more
154	-----	
155	end-of-attributes-tag	1 byte - required
156	-----	
157	data	q bytes - optional
158	-----	

159 The first three fields in the above diagram contain the value of attributes described in section 3.1.1 of the Model document.

160 The fourth field is the "attribute-group" field, and it occurs 0 or more times. Each "attribute-group" field represents a single group
 161 of attributes, such as an Operation Attributes group or a Job Attributes group (see the Model document). The IPP model
 162 document specifies the required attribute groups and their order for each operation request and response.

163 The "end-of-attributes-tag" field is always present, even when the "data" is not present. The Model document specifies for each
 164 operation request and response whether the "data" field is present or absent.

165 3.1.2 Attribute Group

166 Each "attribute-group" field is encoded as follows:

167	-----	
168	begin-attribute-group-tag	1 byte
169	-----	
170	attribute	p bytes - 0 or more
171	-----	

172

173 The "begin-attribute-group-tag" field marks the beginning of an "attribute-group" field and its value identifies the type of
 174 attribute group, e.g. Operations Attributes group versus a Job Attributes group. The "begin-attribute-group-tag" field also marks
 175 the end of the previous attribute group except for the "begin-attribute-group-tag" field in the first "attribute-group" field of a
 176 request or response. The "begin-attribute-group-tag" field acts as an "attribute-group" terminator because an "attribute-group"
 177 field cannot nest inside another "attribute-group" field.

178 An "attribute-group" field contains zero or more "attribute" fields.

179 Note, the values of the "begin-attribute-group-tag" field and the "end-of-attributes-tag" field are called "delimiter-tags".

180 3.1.3 Attribute

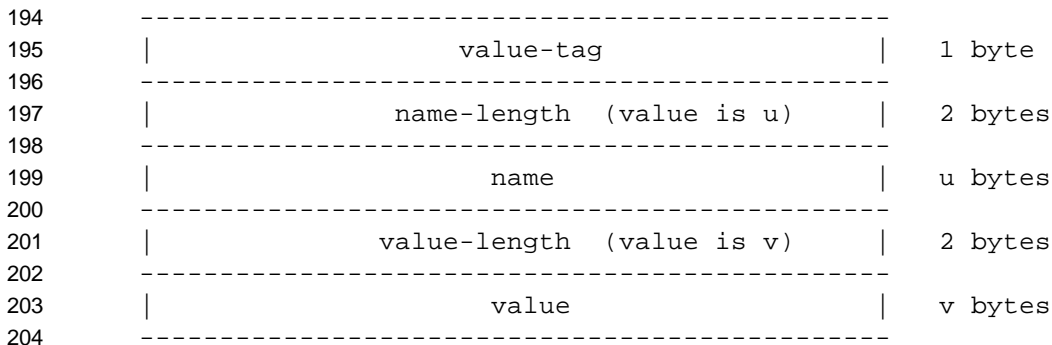

181 An "attribute" field is encoded as follows:

188 When an attribute is single valued (e.g. "copies" with value of 10) or multi-valued with one value (e.g. "sides-supported" with just
189 the value 'one-sided') it is encoded with just an "attribute-with-one-value" field. When an attribute is multi-valued with n values
190 (e.g. "sides-supported" with the values 'one-sided' and 'two-sided-long-edge'), it is encoded with an "attribute-with-one-value"
191 field followed by n-1 "additional-value" fields.

192 3.1.4 Picture of the Encoding of an Attribute-with-one-value

193 Each "attribute-with-one-value" field is encoded as follows:

205 An "attribute-with-one-value" field is encoded with five subfields:

206 The "value-tag" field specifies the attribute syntax, e.g. 0x44 for the attribute syntax 'keyword'.

207 The "name-length" field specifies the length of the "name" field in bytes, e.g. u in the above diagram or 15 for the name
208 "sides-supported".

209 The "name" field contains the textual name of the attribute, e.g. "sides-supported".

210 The "value-length" field specifies the length of the "value" field in bytes, e.g. v in the above diagram or 9 for the (keyword)
211 value 'one-sided'.

212 The "value" field contains the value of the attribute, e.g. the textual value 'one-sided'.

213 3.1.5 Additional-value

214 Each "additional-value" field is encoded as follows:

215	-----	
216	value-tag	1 byte
217	-----	
218	name-length (value is 0x0000)	2 bytes
219	-----	
220	value-length (value is w)	2 bytes
221	-----	
222	value	w bytes
223	-----	

224

225 An "additional-value" is encoded with four subfields:

226 The "value-tag" field specifies the attribute syntax, e.g. 0x44 for the attribute syntax 'keyword'.

227 The "name-length" field has the value of 0 in order to signify that it is an "additional-value". The value of the "name-length" field distinguishes an "additional-value" field ("name-length" is 0) from an "attribute-with-one-value" field ("name-length" is not 0).

230 The "value-length" field specifies the length of the "value" field in bytes, e.g. w in the above diagram or 19 for the (keyword) value 'two-sided-long-edge'.

232 The "value" field contains the value of the attribute, e.g. the textual value 'two-sided-long-edge'.

233 3.1.6 Alternative Picture of the Encoding of a Request Or a Response

234 From the standpoint of a parser that performs an action based on a "tag" value, the encoding consists of:

235	-----	
236	version-number	2 bytes - required
237	-----	
238	operation-id (request)	2 bytes - required
239	or	
240	status-code (response)	
241	-----	
242	request-id	4 bytes - required
243	-----	
244	tag (delimiter-tag or value-tag)	1 byte
245	-----	-0 or more
246	empty or rest of attribute	x bytes
247	-----	
248	end-of-attributes-tag	1 byte - required
249	-----	
250	data	y bytes - optional
251	-----	

252

253 The following show what fields the parser would expect after each type of "tag":

254 - "begin-attribute-group-tag": expect zero or more "attribute" fields

- 255 - "value-tag": expect the remainder of an "attribute-with-one-value" or an "additional-value".
- 256 - "end-of-attributes-tag": expect that "attribute" fields are complete and there is optional "data"

257 3.2 Syntax of Encoding

258 The syntax below is ABNF [RFC2234] except 'strings of literals' MUST be case sensitive. For example 'a' means lower case 'a' and
 259 not upper case 'A'. In addition, SIGNED-BYTE and SIGNED-SHORT fields are represented as '%x' values which show their range
 260 of values.

```

261 ipp-message = ipp-request / ipp-response
262 ipp-request = version-number operation-id request-id
263             *attribute-group end-of-attributes-tag data
264 ipp-response = version-number status-code request-id
265             *attribute-group end-of-attributes-tag data
266 attribute-group = begin-attribute-group-tag *attribute
267
268
269
270 version-number = major-version-number minor-version-number
271 major-version-number = SIGNED-BYTE
272 minor-version-number = SIGNED-BYTE
273
274 operation-id = SIGNED-SHORT ; mapping from model defined below
275 status-code = SIGNED-SHORT ; mapping from model defined below
276 request-id = SIGNED-INTEGER ; whose value is > 0
277
278 attribute = attribute-with-one-value *additional-value
279
280 attribute-with-one-value = value-tag name-length name
281                          value-length value
282 additional-value = value-tag zero-name-length value-length value
283
284 name-length = SIGNED-SHORT ; number of octets of 'name'
285 name = LALPHA *( LALPHA / DIGIT / "-" / "_" / "." )
286 value-length = SIGNED-SHORT ; number of octets of 'value'
287 value = OCTET-STRING
288
289 data = OCTET-STRING
290
291 zero-name-length = %x00.00 ; name-length of 0
292 value-tag = %x10-FF ; see section 3.7.2
293 begin-attribute-group-tag = %x00-02 / %04-0F ; see section 3.7.1
294 end-of-attributes-tag = %x03 ; tag of 3
295 ; see section 3.7.1
296 SIGNED-BYTE = BYTE
297 SIGNED-SHORT = 2BYTE
298 SIGNED-INTEGER = 4BYTE
299 DIGIT = %x30-39 ; "0" to "9"
300 LALPHA = %x61-7A ; "a" to "z"
301 BYTE = %x00-FF
302 OCTET-STRING = *BYTE
303

```

304 The syntax below defines additional terms that are referenced in this document. This syntax provides an alternate grouping of the
 305 delimiter tags.

306
 307 delimiter-tag = begin-attribute-group-tag / ; see section 3.7.1
 308 end-of-attributes-tag
 309 delimiter-tag = %x00-0F ; see section 3.7.1
 310
 311 begin-attribute-group-tag = %x00 / operation-attributes-tag /
 312 job-attributes-tag / printer-attributes-tag /
 313 unsupported-attributes-tag / %x06-0F
 314 operation-attributes-tag = %x01 ; tag of 1
 315 job-attributes-tag = %x02 ; tag of 2
 316 printer-attributes-tag = %x04 ; tag of 4
 317 unsupported-attributes-tag = %x05 ; tag of 5
 318
 319

320 **3.3 Attribute-group**

321 Each "attribute-group" field MUST be encoded with the "begin-attribute-group-tag" field followed by zero or more "attribute"
 322 sub-fields.

323 The table below maps the model document group name to value of the "begin-attribute-group-tag" field:

Model Document Group	"begin-attribute-group-tag" field values
Operation Attributes	"operations-attributes-tag"
Job Template Attributes	"job-attributes-tag"
Job Object Attributes	"job-attributes-tag"
Unsupported Attributes	"unsupported-attributes-tag"
Requested Attributes (Get-Job-Attributes)	"job-attributes-tag"
Requested Attributes (Get-Printer-Attributes)	"printer-attributes-tag"
Document Content	in a special position as described above

324

325 For each operation request and response, the model document prescribes the required and optional attribute groups, along with
 326 their order. Within each attribute group, the model document prescribes the required and optional attributes, along with their
 327 order.

328 When the Model document requires an attribute group in a request or response and the attribute group contains zero attributes, a
 329 request or response SHOULD encode the attribute group with the "begin-attribute-group-tag" field followed by zero "attribute"
 330 fields. For example, if the client requests a single unsupported attribute with the Get-Printer-Attributes operation, the Printer
 331 MUST return no "attribute" fields, and it SHOULD return a "begin-attribute-group-tag" field for the Printer Attributes Group. The
 332 Unsupported Attributes group is not such an example. According to the model document, the Unsupported Attributes Group
 333 SHOULD be present only if the unsupported attributes group contains at least one attribute.

334 A receiver of a request MUST be able to process the following as equivalent empty attribute groups:

- 335 a) A "begin-attribute-group-tag" field with zero following "attribute" fields.
- 336 b) An expected but missing "begin-attribute-group-tag" field.

337 When the Model document requires a sequence of an unknown number of attribute groups, each of the same type, the encoding
338 MUST contain one "begin-attribute-group-tag" field for each attribute group even when an "attribute-group" field contains zero
339 "attribute" sub-fields. For example, for the Get-Jobs operation may return zero attributes for some jobs and not others. The
340 "begin-attribute-group-tag" field followed by zero "attribute" fields tells the recipient that there is a job in queue for which no
341 information is available except that it is in the queue.

342 **3.4 Required Parameters**

343 Some operation elements are called parameters in the model document [ipp-mod]. They MUST be encoded in a special position
344 and they MUST NOT appear as operation attributes. These parameters are described in the subsections below.

345 **3.4.1 Version-number**

346 The "version-number" field MUST consist of a major and minor version-number, each of which MUST be represented by a
347 SIGNED-BYTE. The major version-number MUST be the first byte of the encoding and the minor version-number MUST be the
348 second byte of the encoding. The protocol described in this document MUST have a major version-number of 1 (0x01) and a
349 minor version-number of 1 (0x01). The ABNF for these two bytes MUST be %x01.01.

350 **3.4.2 Operation-id**

351 The "operation-id" field MUST contain an operation-id value defined in the model document. The value MUST be encoded as a
352 SIGNED-SHORT and it MUST be in the third and fourth bytes of the encoding of an operation request.

353 **3.4.3 Status-code**

354 The "status-code" field MUST contain a status-code value defined in the model document. The value MUST be encoded as a
355 SIGNED-SHORT and it MUST be in the third and fourth bytes of the encoding of an operation response.

356 The status-code is an operation attribute in the model document. In the protocol, the status-code is in a special position, outside
357 of the operation attributes.

358 If an IPP status-code is returned, then the HTTP Status-Code MUST be 200 (successful-ok). With any other HTTP Status-Code
359 value, the HTTP response MUST NOT contain an IPP message-body, and thus no IPP status-code is returned.

360 **3.4.4 Request-id**

361 The "request-id" field MUST contain a request-id value as defined in the model document. The value MUST be encoded as a
362 SIGNED-INTEGER and it MUST be in the fifth through eighth bytes of the encoding.

363 **3.5 Tags**

364 There are two kinds of tags:

- 365 - delimiter tags: delimit major sections of the protocol, namely attributes and data
- 366 - value tags: specify the type of each attribute value

367 **3.5.1 Delimiter Tags**

368 The following table specifies the values for the delimiter tags:

Tag Value (Hex)	Meaning
0x00	reserved for definition in a future IETF standards track document
0x01	"operation-attributes-tag"
0x02	"job-attributes-tag"
0x03	"end-of-attributes-tag"
0x04	"printer-attributes-tag"
0x05	"unsupported-attributes-tag"
0x06-0x0f	reserved for future delimiters in IETF standards track documents

369 When a "begin-attribute-group-tag" field occurs in the protocol, it means that zero or more following attributes up to the next
 370 delimiter tag **MUST** be attributes belonging to the attribute group specified by the value of the "begin-attribute-group-tag". For
 371 example, if the value of "begin-attribute-group-tag" is 0x01, the following attributes **MUST** be members of the Operations
 372 Attributes group.

373 The "end-of-attributes-tag" (value 0x03) **MUST** occur exactly once in an operation. It **MUST** be the last "delimiter-tag". If the
 374 operation has a document-content group, the document data in that group **MUST** follow the "end-of-attributes-tag".

375 The order and presence of "attribute-group" fields (whose beginning is marked by the "begin-attribute-group-tag" subfield) for
 376 each operation request and each operation response **MUST** be that defined in the model document. For further details, see
 377 section 3.7 "(Attribute) Name" and 13 "Appendix A: Protocol Examples".

378 A Printer **MUST** treat a "delimiter-tag" (values from 0x00 through 0x0F) differently from a "value-tag" (values from 0x10 through
 379 0xFF) so that the Printer knows that there is an entire attribute group that it doesn't understand as opposed to a single value that
 380 it doesn't understand.

381 **3.5.2 Value Tags**

382 The remaining tables show values for the "value-tag" field, which is the first octet of an attribute. The "value-tag" field specifies
 383 the type of the value of the attribute.

384 The following table specifies the "out-of-band" values for the "value-tag" field.

Tag Value (Hex)	Meaning
0x10	unsupported
0x11	reserved for 'default' for definition in a future IETF standards track document
0x12	unknown
0x13	no-value
0x14-0x1F	reserved for "out-of-band" values in future IETF standards track documents.

385
 386 The following table specifies the integer values for the "value-tag" field:

Tag Value (Hex)	Meaning
0x20	reserved for definition in a future IETF standards track document
0x21	integer
0x22	boolean
0x23	enum
0x24-0x2F	reserved for integer types for definition in future IETF standards track documents

387 NOTE: 0x20 is reserved for "generic integer" if it should ever be needed.

388 The following table specifies the octetString values for the "value-tag" field:

Tag Value (Hex)	Meaning
0x30	octetString with an unspecified format
0x31	dateTime
0x32	resolution
0x33	rangeOfInteger
0x34	reserved for definition in a future IETF standards track document
0x35	textWithLanguage
0x36	nameWithLanguage
0x37-0x3F	reserved for octetString type definitions in future IETF standards track documents

389 The following table specifies the character-string values for the "value-tag" field:

Tag Value (Hex)	Meaning
0x40	reserved for definition in a future IETF standards track document
0x41	textWithoutLanguage
0x42	nameWithoutLanguage
0x43	reserved for definition in a future IETF standards track document
0x44	keyword
0x45	uri
0x46	uriScheme
0x47	charset
0x48	naturalLanguage
0x49	mimeMediaType
0x4A-0x5F	reserved for character string type definitions in future IETF standards track documents

390 NOTE: 0x40 is reserved for "generic character-string" if it should ever be needed.

391 NOTE: an attribute value always has a type, which is explicitly specified by its tag; one such tag value is
392 "nameWithoutLanguage". An attribute's name has an implicit type, which is keyword.

393 The values 0x60-0xFF are reserved for future type definitions in IETF standards track documents.

394 The tag 0x7F is reserved for extending types beyond the 255 values available with a single byte. A tag value of 0x7F MUST
395 signify that the first 4 bytes of the value field are interpreted as the tag value. Note this future extension doesn't affect parsers
396 that are unaware of this special tag. The tag is like any other unknown tag, and the value length specifies the length of a value,
397 which contains a value that the parser treats atomically. Values from 0x00 to 0x37777777 are reserved for definition in future IETF
398 standard track documents. The values 0x40000000 to 0x7FFFFFFF are reserved for vendor extensions.

399 **3.6 Name-Length**

400 The "name-length" field MUST consist of a SIGNED-SHORT. This field MUST specify the number of octets in the immediately
401 following "name" field. The value of this field excludes the two bytes of the "name-length" field. For example, if the "name" field
402 contains "sides", the value of this field is 5.

403 If a "name-length" field has a value of zero, the following "name" field MUST be empty, and the following value MUST be treated
404 as an additional value for the attribute encoded in the nearest preceding "attribute-with-one-value" field. Within an attribute
405 group, if two or more attributes have the same name, the attribute group is mal-formed (see [ipp-mod] section 3.1.3). The zero-
406 length name is the only mechanism for multi-valued attributes.

407 **3.7 (Attribute) Name**

408 The "name" field MUST contain the name of an attribute. The model document [ipp-mod] specifies such names.

409 **3.8 Value Length**

410 The "value-length" field MUST consist of a SIGNED-SHORT. This field MUST specify the number of octets in the immediately
411 following "value" field. The value of this field excludes the two bytes of the "value-length" field. For example, if the "value" field
412 contains the keyword (text) value 'one-sided', the value of this field is 9.

413 For any of the types represented by binary signed integers, the sender MUST encode the value in exactly four octets.

414 For any of the types represented by character-strings, the sender MUST encode the value with all the characters of the string and
415 without any padding characters.

416 For "out-of-band" "value-tag" fields defined in this document, such as "unsupported", the "value-length" MUST be 0 and the
417 "value" empty; the "value" has no meaning when the "value-tag" has one of these "out-of-band" values. For future "out-of-
418 band" "value-tag" fields, the same rule holds unless the definition explicitly states that the "value-length" MAY be non-zero and
419 the "value" non-empty

420 **3.9 (Attribute) Value**

422 The syntax types (specified by the "value-tag" field) and most of the details of the representation of attribute values are defined
423 in the IPP model document. The table below augments the information in the model document, and defines the syntax types from
424 the model document in terms of the 5 basic types defined in section 3 "Encoding of the Operation Layer". The 5 types are US-
425 ASCII-STRING, LOCALIZED-STRING, SIGNED-INTEGER, SIGNED-SHORT, SIGNED-BYTE, and OCTET-STRING.

Syntax of Attribute Value	Encoding
textWithoutLanguage, nameWithoutLanguage	LOCALIZED-STRING.
textWithLanguage	OCTET-STRING consisting of 4 fields: <ul style="list-style-type: none"> a. a SIGNED-SHORT which is the number of octets in the following field b. a value of type natural-language, c. a SIGNED-SHORT which is the number of octets in the following field, d. a value of type textWithoutLanguage. The length of a textWithLanguage value MUST be 4 + the value of field a + the value of field c.
nameWithLanguage	OCTET-STRING consisting of 4 fields: <ul style="list-style-type: none"> a. a SIGNED-SHORT which is the number of octets in the following field b. a value of type natural-language, c. a SIGNED-SHORT which is the number of octets in the following field d. a value of type nameWithoutLanguage. The length of a nameWithLanguage value MUST be 4 + the value of field a + the value of field c.
charset, naturalLanguage, mimeMediaType, keyword, uri, and uriScheme	US-ASCII-STRING.
boolean	SIGNED-BYTE where 0x00 is 'false' and 0x01 is 'true'.
integer and enum	a SIGNED-INTEGER.
dateTime	OCTET-STRING consisting of eleven octets whose contents are defined by "DateAndTime" in RFC 1903 [RFC1903].
resolution	OCTET-STRING consisting of nine octets of 2 SIGNED-INTEGERS followed by a SIGNED-BYTE. The first SIGNED-INTEGER contains the value of cross feed direction resolution. The second SIGNED-INTEGER contains the value of feed direction resolution. The SIGNED-BYTE contains the units value.
rangeOfInteger	Eight octets consisting of 2 SIGNED-INTEGERS. The first SIGNED-INTEGER contains the lower bound and the second SIGNED-INTEGER contains the upper bound.
1setOf X	Encoding according to the rules for an attribute with more than 1 value. Each value X is encoded according to the rules for encoding its type.
octetString	OCTET-STRING

426 The attribute syntax type of the value determines its encoding and the value of its "value-tag".

427 3.10 Data

428 The "data" field MUST include any data required by the operation

429 4. Encoding of Transport Layer

430 HTTP/1.1 [RFC2616] is the transport layer for this protocol.

431 The operation layer has been designed with the assumption that the transport layer contains the following information:

- 432 - the URI of the target job or printer operation
- 433 - the total length of the data in the operation layer, either as a single length or as a sequence of chunks each with a length.
- 434

435 It is REQUIRED that a printer implementation support HTTP over the IANA assigned Well Known Port 631 (the IPP default port),
436 though a printer implementation may support HTTP over some other port as well.

437 Each HTTP operation MUST use the POST method where the request-URI is the object target of the operation, and where the
438 "Content-Type" of the message-body in each request and response MUST be "application/ipp". The message-body MUST
439 contain the operation layer and MUST have the syntax described in section 3.2 "Syntax of Encoding". A client implementation
440 MUST adhere to the rules for a client described for HTTP1.1 [RFC2616] . A printer (server) implementation MUST adhere the rules
441 for an origin server described for HTTP1.1 [RFC2616].

442 An IPP server sends a response for each request that it receives. If an IPP server detects an error, it MAY send a response before
443 it has read the entire request. If the HTTP layer of the IPP server completes processing the HTTP headers successfully, it MAY
444 send an intermediate response, such as "100 Continue", with no IPP data before sending the IPP response. A client MUST expect
445 such a variety of responses from an IPP server. For further information on HTTP/1.1, consult the HTTP documents [RFC2616].

446 An HTTP server MUST support chunking for IPP requests, and an IPP client MUST support chunking for IPP responses
447 according to HTTP/1.1[RFC2616]. Note: this rule causes a conflict with non-compliant implementations of HTTP/1.1 that don't
448 support chunking for POST methods, and this rule may cause a conflict with non-compliant implementations of HTTP/1.1 that
449 don't support chunking for CGI scripts

450 4.1 Printer-uri and job-uri

451 All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [RFC2396] so that they can be persistently and
452 unambiguously referenced. The notion of a URI is a useful concept, however, until the notion of URI is more stable (i.e., defined
453 more completely and deployed more widely), it is expected that the URIs used for IPP objects will actually be URLs [RFC1738]
454 [RFC1808]. Since every URL is a specialized form of a URI, even though the more generic term URI is used throughout the rest of
455 this document, its usage is intended to cover the more specific notion of URL as well.

456 Some operation elements are encoded twice, once as the request-URI on the HTTP Request-Line and a second time as a
457 REQUIRED operation attribute in the application/ipp entity. These attributes are the target URI for the operation and are called
458 printer-uri and job-uri. Note: The target URI is included twice in an operation referencing the same IPP object, but the two URIs
459 NEED NOT be literally identical. One can be a relative URI and the other can be an absolute URI. HTTP/1.1 allows clients to
460 generate and send a relative URI rather than an absolute URI. A relative URI identifies a resource with the scope of the HTTP
461 server, but does not include scheme, host or port. The following statements characterize how URLs should be used in the
462 mapping of IPP onto HTTP/1.1:

- 463 1. Although potentially redundant, a client MUST supply the target of the operation both as an operation attribute and as
464 a URI at the HTTP layer. The rationale for this decision is to maintain a consistent set of rules for mapping
465 application/ipp to possibly many communication layers, even where URLs are not used as the addressing mechanism in
466 the transport layer.
- 467 2. Even though these two URLs might not be literally identical (one being relative and the other being absolute), they
468 MUST both reference the same IPP object. However, a Printer NEED NOT verify that the two URLs reference the same
469 IPP object, and NEED NOT take any action if it determines the two URLs to be different.

- 470 3. The URI in the HTTP layer is either relative or absolute and is used by the HTTP server to route the HTTP request to
 471 the correct resource relative to that HTTP server. The HTTP server need not be aware of the URI within the operation
 472 request.
- 473 4. Once the HTTP server resource begins to process the HTTP request, it might get the reference to the appropriate IPP
 474 Printer object from either the HTTP URI (using to the context of the HTTP server for relative URLs) or from the URI
 475 within the operation request; the choice is up to the implementation.
- 476 5. HTTP URIs can be relative or absolute, but the target URI in the operation MUST be an absolute URI.

477 5. IPP URL Scheme

478 The IPP/1.1 document defines a new scheme 'ipp' as the value of a URL that identifies either an IPP printer object or an IPP job
 479 object. The IPP attributes using the 'ipp' scheme are specified below. Because the HTTP layer does not support the 'ipp' scheme,
 480 a client MUST map 'ipp' URLs to 'http' URLs, and then follows the HTTP [RFC2616][RFC2617] rules for constructing a Request-
 481 Line and HTTP headers. The mapping is simple because the 'ipp' scheme implies all of the same protocol semantics as that of the
 482 'http' scheme [RFC2616], except that it represents a print service and the implicit (default) port number that clients use to connect
 483 to a server is port 631.

484 In the remainder of this section the term 'ipp-URL' means a URL whose scheme is 'ipp' and whose implicit (default) port is 631. The
 485 term 'http-URL' means a URL whose scheme is 'http', and the term 'https-URL' means a URL whose scheme is 'https'.

486 A client and an IPP object (i.e. the server) MUST support the ipp-URL value in the following IPP attributes.

487 job attributes:

488 job-uri

489 job-printer-uri

490 printer attributes:

491 printer-uri-supported

492 operation attributes:

493 job-uri

494 printer-uri

495 Each of the above attributes identifies a printer or job object. The ipp-URL is intended as the value of the attributes in this list,
 496 and for no other attributes. All of these attributes have a syntax type of 'uri', but there are attributes with a syntax type of 'uri' that
 497 do not use the 'ipp' scheme, e.g. 'job-more-info'.

498

499 If a printer registers its URL with a directory service, the printer MUST register an ipp-URL.

500 User interfaces are beyond the scope of this document. But if software exposes the ipp-URL values of any of the above five
 501 attributes to a human user, it is REQUIRED that the human see the ipp-URL as is.

502

503 When a client sends a request, it MUST convert a target ipp-URL to a target http-URL for the HTTP layer according to the
 504 following rules:

505 1. change the 'ipp' scheme to 'http'

506 2. add an explicit port 631 if the URL does not contain an explicit port. Note: port 631 is the IANA assigned Well Known
 507 Port for the 'ipp' scheme.

508 The client MUST use the target http-URL in both the HTTP Request-Line and HTTP headers, as specified by
 509 HTTP[RFC2616][RFC2617]. However, the client MUST use the target ipp-URL for the value of the "printer-uri" or "job-uri"
 510 operation attribute within the application/ipp body of the request. The server MUST use the ipp-URL for the value of the "printer-
 511 uri", "job-uri" or "printer-uri-supported" attributes within the application/ipp body of the response.

512

513 For example, when an IPP client sends a request directly (i.e. no proxy) to an ipp-URL "ipp://myhost.com/myprinter/myqueue", it
 514 opens a TCP connection to port 631 (the ipp implicit port) on the host "myhost.com" and sends the following data:

515

516 POST /myprinter/myqueue HTTP/1.1

517 Host: myhost.com:631
518 Content-type: application/ipp
519 Transfer-Encoding: chunked
520 ...
521 "printer-uri" "ipp://myhost.com/myprinter/myqueue"
522 (encoded in application/ipp message body)
523 ...
524

525 As another example, when an IPP client sends the same request as above via a proxy "myproxy.com", it opens a TCP connection
526 to the proxy port 8080 on the proxy host "myproxy.com" and sends the following data:
527

528 POST http://myhost.com:631/myprinter/myqueue HTTP/1.1
529 Host: myhost.com:631
530 Content-type: application/ipp
531 Transfer-Encoding: chunked
532 ...
533 "printer-uri" "ipp://myhost.com/myprinter/myqueue"
534 (encoded in application/ipp message body)
535 ...
536

537 The proxy then connects to the IPP origin server with headers that are the same as the "no-proxy" example above.

538 6. IANA Considerations

539 This section describes the procedures for allocating encoding for the following IETF standards track extensions and vendor
540 extensions to the IPP/1.1 Encoding and Transport document:

- 541 1. attribute syntaxes - see [ipp-mod] section 6.3
 - 542 2. attribute groups - see [ipp-mod] section 6.5
 - 543 3. out-of-band attribute values - see [ipp-mod] section 6.7
- 544

545 These extensions follow the "type2" registration procedures defined in [ipp-mod] section 6. Extensions registered for use with
546 IPP/1.1 are OPTIONAL for client and IPP object conformance to the IPP/1.1 Encoding and Transport document.

547 These extension procedures are aligned with the guidelines as set forth by the IESG [IANA-CON]. The [ipp-mod] Section 11
548 describes how to propose new registrations for consideration. IANA will reject registration proposals that leave out required
549 information or do not follow the appropriate format described in [ipp-mod] Section 11. The IPP/1.1 Encoding and Transport
550 document may also be extended by an appropriate RFC that specifies any of the above extensions.

551 7. Internationalization Considerations

552 See the section on "Internationalization Considerations" in the document "Internet Printing Protocol/1.1: Model and Semantics"
553 [ipp-mod] for information on internationalization. This document adds no additional issues.

554 8. Security Considerations

555 The IPP Model and Semantics document [ipp-mod] discusses high level security requirements (Client Authentication, Server
556 Authentication and Operation Privacy). Client Authentication is the mechanism by which the client proves its identity to the

557 server in a secure manner. Server Authentication is the mechanism by which the server proves its identity to the client in a secure
558 manner. Operation Privacy is defined as a mechanism for protecting operations from eavesdropping.

559 **8.1 Security Conformance Requirements**

560 This section defines the security requirements for IPP clients and IPP objects.

561 **8.1.1 Digest Authentication**

562 IPP clients **MUST** support:

563 Digest Authentication [RFC2617].

564 MD5 and MD5-sess **MUST** be implemented and supported.

565 The Message Integrity feature **NEED NOT** be used.

566

567 IPP Printers **SHOULD** support:

568 Digest Authentication [RFC2617].

569 MD5 and MD5-sess **MUST** be implemented and supported.

570 The Message Integrity feature **NEED NOT** be used.

571 The reasons that IPP Printers **SHOULD** (rather than **MUST**) support Digest Authentication are:

572

573 1. While Client Authentication is important, there is a certain class of printer devices where it does not make sense. Specifically,
574 a low-end device with limited ROM space and low paper throughput may not need Client Authentication. This class of
575 device typically requires firmware designers to make trade-offs between protocols and functionality to arrive at the lowest-
576 cost solution possible. Factored into the designer's decisions is not just the size of the code, but also the testing,
577 maintenance, usefulness, and time-to-market impact for each feature delivered to the customer. Forcing such low-end devices
578 to provide security in order to claim IPP/1.1 conformance would not make business sense and could potentially stall the
579 adoption of the standard.

580

581 2. Print devices that have high-volume throughput and have available ROM space have a compelling argument to provide
582 support for Client Authentication that safeguards the device from unauthorized access. These devices are prone to a high
583 loss of consumables and paper if unauthorized access should occur.

584

585 **8.1.2 Transport Layer Security (TLS)**

586 IPP Printers **SHOULD** support Transport Layer Security (TLS) [RFC2246] for Server Authentication and Operation Privacy. IPP
587 Printers **MAY** also support TLS for Client Authentication. If an IPP Printer supports TLS, it **MUST** support the
588 TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA cipher suite as mandated by RFC 2246 [RFC2246]. All other cipher suites are
589 **OPTIONAL**. An IPP Printer **MAY** support Basic Authentication (described in HTTP/1.1 [RFC2617]) for Client Authentication if
590 the channel is secure. TLS with the above mandated cipher suite can provide such a secure channel.

591 If a IPP client supports TLS, it **MUST** support the TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA cipher suite as mandated by
592 RFC 2246 [RFC2246]. All other cipher suites are **OPTIONAL**.

593 The IPP Model and Semantics document defines two printer attributes ("uri-authentication-supported" and "uri-security-
594 supported") that the client can use to discover the security policy of a printer. That document also outlines IPP-specific security

595 considerations and should be the primary reference for security implications with regard to the IPP protocol itself. For backward
596 compatibility with IPP version 1.0, IPP clients and printers may also support SSL3 [ssl]. This is in addition to the security required
597 in this document.

598 **8.2 Using IPP with TLS**

599 IPP/1.1 uses the "Upgrading to TLS Within HTTP/1.1" mechanism [RFC2817]. An initial IPP request never uses TLS. The client
600 requests a secure TLS connection by using the HTTP "Upgrade" header, while the server agrees in the HTTP response. The
601 switch to TLS occurs either because the server grants the client's request to upgrade to TLS, or a server asks to switch to TLS in
602 its response. Secure communication begins with a server's response to switch to TLS.

603 **9. Interoperability with IPP/1.0 Implementations**

604 It is beyond the scope of this specification to mandate conformance with previous versions. IPP/1.1 was deliberately designed,
605 however, to make supporting previous versions easy. It is worth noting that, at the time of composing this specification (1999),
606 we would expect IPP/1.1 Printer implementations to:

607 understand any valid request in the format of IPP/1.0, or 1.1;

608 respond appropriately with a response containing the same "version-number" parameter value used by the client in the
609 request.

610 And we would expect IPP/1.1 clients to:

611 understand any valid response in the format of IPP/1.0, or 1.1.

612 **9.1 The "version-number" Parameter**

613 The following are rules regarding the "version-number" parameter (see section 3.3):

- 614 1. Clients **MUST** send requests containing a "version-number" parameter with a '1.1' value and **SHOULD** try supplying
615 alternate version numbers if they receive a 'server-error-version-not-supported' error return in a response.
- 616 2. IPP objects **MUST** accept requests containing a "version-number" parameter with a '1.1' value (or reject the request for
617 reasons other than 'server-error-version-not-supported').
- 618 3. It is recommended that IPP objects accept any request with the major version '1' (or reject the request for reasons other
619 than 'server-error-version-not-supported'). See [ipp-mod] "versions" sub-section.
- 620 4. In any case, security **MUST NOT** be compromised when a client supplies a lower "version-number" parameter in a
621 request. For example, if an IPP/1.1 conforming Printer object accepts version '1.0' requests and is configured to enforce
622 Digest Authentication, it **MUST** do the same for a version '1.0' request.

623 **9.2 Security and URL Schemes**

624 The following are rules regarding security, the "version-number" parameter, and the URL scheme supplied in target attributes and
625 responses:

- 626 1. When a client supplies a request, the "printer-uri" or "job-uri" target operation attribute MUST have the same scheme
627 as that indicated in one of the values of the "printer-uri-supported" Printer attribute.
- 628 2. When the server returns the "job-printer-uri" or "job-uri" Job Description attributes, it SHOULD return the same
629 scheme ('ipp', 'https', 'http', etc.) that the client supplied in the "printer-uri" or "job-uri" target operation attributes in the
630 Get-Job-Attributes or Get-Jobs request, rather than the scheme used when the job was created. However, when a
631 client requests job attributes using the Get-Job-Attributes or Get-Jobs operations, the jobs and job attributes that the
632 server returns depends on: (1) the security in effect when the job was created, (2) the security in effect in the query
633 request, and (3) the security policy in force.
- 634 3. It is recommended that if a server registers a non-secure ipp-URL with a directory service (see [IPP-MOD] "Generic
635 Directory Schema" Appendix), then it also register an http-URL for interoperability with IPP/1.0 clients (see section 9).
- 636 4. In any case, security MUST NOT be compromised when a client supplies an 'http' or other non-secure URL scheme in
637 the target "printer-uri" and "job-uri" operation attributes in a request.

687

688 **13. Appendix A: Protocol Examples**

689 **13.1 Print-Job Request**

690 The following is an example of a Print-Job request with job-name, copies, and sides specified. The "ipp-attribute-fidelity" attribute
 691 is set to 'true' so that the print request will fail if the "copies" or the "sides" attribute are not supported or their values are not
 692 supported.

694 **13.2 Print-Job Response (successful)**

695 Here is an example of a successful Print-Job response to the previous Print-Job request. The printer supported the "copies" and
 696 "sides" attributes and their supplied values. The status code returned is 'successful-ok'.

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0000	successful-ok	status-code
0x00000001	1	request-id

697
 698

698

699 **13.3 Print-Job Response (failure)**

700 Here is an example of an unsuccessful Print-Job response to the previous Print-Job request. It fails because, in this case, the
 701 printer does not support the "sides" attribute and because the value '20' for the "copies" attribute is not supported. Therefore, no
 702 job is created, and neither a "job-id" nor a "job-uri" operation attribute is returned. The error code returned is 'client-error-
 703 attributes-or-values-not-supported' (0x040B).
 704

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x040B	client-error-attributes-or-values-not-supported	status-code

0x03	end-of-attributes	end-of-attributes-tag

705

706

706
707 **13.4 Print-Job Response (success with attributes ignored)**

708 Here is an example of a successful Print-Job response to a Print-Job request like the previous Print-Job request, except that the
709 value of 'ipp-attribute-fidelity' is false. The print request succeeds, even though, in this case, the printer supports neither the
710 "sides" attribute nor the value '20' for the "copies" attribute. Therefore, a job is created, and both a "job-id" and a "job-uri"
711 operation attribute are returned. The unsupported attributes are also returned in an Unsupported Attributes Group. The error
712 code returned is 'successful-ok-ignored-or-substituted-attributes' (0x0001).
713

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0001	successful-ok-ignored-or-substituted-attributes	status-code
0x00000001	1	request-id

730 14. Appendix B: Registration of MIME Media Type Information for 731 "application/ipp"

732 This appendix contains the information that IANA requires for registering a MIME media type. The information following this
733 paragraph will be forwarded to IANA to register application/ipp whose contents are defined in Section 3 "Encoding of the
734 Operation Layer" in this document:

735 **MIME type name:** application

736 **MIME subtype name:** ipp

737 A Content-Type of "application/ipp" indicates an Internet Printing Protocol message body (request or response). Currently there
738 is one version: IPP/1.1, whose syntax is described in Section 3 "Encoding of the Operation Layer" of [ipp-pro], and whose
739 semantics are described in [ipp-mod].

740 **Required parameters:** none

741 **Optional parameters:** none

742 **Encoding considerations:**

743 IPP/1.1 protocol requests/responses MAY contain long lines and ALWAYS contain binary data (for example attribute value
744 lengths).

745 **Security considerations:**

746 IPP/1.1 protocol requests/responses do not introduce any security risks not already inherent in the underlying transport
747 protocols. Protocol mixed-version interworking rules in [ipp-mod] as well as protocol encoding rules in [ipp-pro] are complete and
748 unambiguous.

749 **Interoperability considerations:**

750 IPP/1.1 requests (generated by clients) and responses (generated by servers) MUST comply with all conformance requirements
751 imposed by the normative specifications [ipp-mod] and [ipp-pro]. Protocol encoding rules specified in [ipp-pro] are
752 comprehensive, so that interoperability between conforming implementations is guaranteed (although support for specific
753 optional features is not ensured). Both the "charset" and "natural-language" of all IPP/1.1 attribute values which are a
754 LOCALIZED-STRING are explicit within IPP protocol requests/responses (without recourse to any external information in HTTP,
755 SMTP, or other message transport headers).

756 **Published specifications:**

757 [ipp-mod] Isaacson, S., deBry, R., Hastings, T., Herriot, R., Powell, P., "Internet Printing Protocol/1.1: Model and Semantics"
758 draft-ietf-ipp-model-v11-07.txt, May 22, 2000.

759 [ipp-pro] Herriot, R., Butler, S., Moore, P., Turner, R., "Internet Printing Protocol/1.1: Encoding and Transport", draft-ietf-ipp-
760 protocol-v11-06.txt, May 30, 2000.

761 **Applications which use this media type:**

762 Internet Printing Protocol (IPP) print clients and print servers, communicating using HTTP/1.1 (see [IPP-PRO]), SMTP/ESMTP,
763 FTP, or other transport protocol. Messages of type "application/ipp" are self-contained and transport-independent, including
764 "charset" and "natural-language" context for any LOCALIZED-STRING value.

765 **Person & email address to contact for further information:**

766 Tom Hastings
767 Xerox Corporation
768 737 Hawaii St. ESAE-231
769 El Segundo, CA

770 Phone: 310-333-6413
771 Fax: 310-333-5514
772 Email: hastings@cp10.es.xerox.com

773 or

774 Robert Herriot
775 Xerox Corporation
776 3400 Hillview Ave., Bldg #1
777 Palo Alto, CA 94304

778 Phone: 650-813-7696
779 Fax: 650-813-6860
780 Email: robert.herriot@pahv.xerox.com

781 **Intended usage:**

782 COMMON

783 **15. Appendix C: Changes from IPP/1.0**

784 IPP/1.1 is identical to IPP/1.0 [RFC2565] with the follow changes:

- 785 1. Attributes values that identify a printer or job object use a new 'ipp' scheme. The 'http' and 'https' schemes are supported
786 only for backward compatibility. See section 5.
- 787 2. Clients MUST support of Digest Authentication, IPP Printers SHOULD support Digest Authentication. See Section 8.1.1
- 788 3. TLS is recommended for channel security. In addition, SSL3 may be supported for backward compatibility. See Section 8.1.2
- 789 4. It is recommended that IPP/1.1 objects accept any request with major version number '1'. See section 9.1.
- 790 5. IPP objects SHOULD return the URL scheme requested for "job-printer-uri" and "job-uri" Job Attributes, rather than the URL
791 scheme used to create the job. See section 9.2.

- 792 6. The IANA and Internationalization sections have been added. The terms "private use" and "experimental" have been
793 changed to "vendor extension". The reserved allocations for attribute group tags, attribute syntax tags, and out-of-band
794 attribute values have been clarified as to which are reserved to future IETF standards track documents and which are
795 reserved to vendor extension. Both kinds of extensions use the type2 registration procedures as defined in [ipp-mod].
- 796 7. Clarified that future "out-of-band" value definitions may use the value field if additional information is needed.
- 797
