Job Monitoring MIB - V1.2

<draft-ietf-printmib-job-monitor-08.txt>

Status of this Memo

Abstract

This document has been developed and approved by the Printer Working Group (PWG) as a PWG standard. It is intended to be distributed as an Informational RFC. This document provides a printer industry standard SNMP MIB for (1) monitoring the status and progress of print jobs (2) obtaining resource requirements before a job is processed, (3) monitoring resource consumption while a job is being processed and (4) collecting resource accounting data after the completion of a job. This MIB is intended to be implemented (1) in a printer or (2) in a server that supports one or more printers. Use of the object set is not limited to printing. However, support for services other than printing is outside the scope of this Job Monitoring MIB. Future extensions to this MIB may include, but are not limited to, fax machines and scanners.

46 TABLE OF CONTENTS

Job Monitoring MIB

1 Introduction

This specification defines an official Printer Working Group (PWG) [PWG] standard SNMP MIB for the monitoring of jobs on network printers. This specification is being published as an IETF Information Document for the convenience of the Internet community. In consultation with the IETF Application Area Directors, it was concluded that this MIB specification properly belongs as an Information document, because this MIB monitors a service node on the network, rather than a network node proper.

The Job Monitoring MIB is intended to be implemented by an agent within a printer or the first server closest to the printer, where the printer is either directly connected to the server only or the printer does not contain the job monitoring MIB agent. It is recommended that implementations place the SNMP agent as close as possible to the processing of the print job. This MIB applies to printers with and without spooling capabilities. This MIB is designed to be compatible with most current commonly-used job submission protocols. In most environments that support high function job submission/job control protocols, like ISO DPA[iso-dpa], those protocols would be used to monitor and manage print jobs rather than using the Job Monitoring MIB.

The Job Monitoring MIB consists of a General Group, a Job Submission ID Group, a Job Group, and an Attribute Group. Each group is a table. All accessible objects are read-only. The General Group contains general information that applies to all jobs in a job set. The Job Submission ID table maps the job submission ID that the client uses to identify a job to the jmJobIndex that the Job Monitoring Agent uses to identify jobs in the Job and Attribute tables. The Job table contains the MANDATORY integer job state and status objects. The Attribute table consists of multiple entries per job that specify (1) job and document identification and parameters, (2) requested resources, and (3) consumed resources during and after job processing/printing. A larger number of job attributes are defined as textual conventions that an agent SHALL return if the server or device implements the functionality so represented and the agent has access to the information.

1.1 Types of Information in the MIB

The job MIB is intended to provide the following information for the indicated Role Models in the Printer MIB[print-mib] (Appendix D - Roles of Users).

User:

Provide the ability to identify the least busy printer. The user will be able to determine the number and size of jobs waiting for each printer. No attempt is made to actually predict the length of time that jobs will take.

Provide the ability to identify the current status of the user's job (user queries).

Provide a timely indication that the job has completed and where it can be found.

Provide error and diagnostic information for jobs that did not successfully complete.

Operator:

Provide a presentation of the state of all the jobs in the print system.

Provide the ability to identify the user that submitted the print job.

Provide the ability to identify the resources required by each job.

Provide the ability to define which physical printers are candidates for the print job.

Provide some idea of how long each job will take. However, exact estimates of time to process a job is not being attempted. Instead, objects are included that allow the operator to be able to make gross estimates.

Capacity Planner:

Provide the ability to determine printer utilization as a function of time.

Provide the ability to determine how long jobs wait before starting to print.

Accountant:

Provide information to allow the creation of a record of resources consumed and printer usage data for charging users or groups for resources consumed.

Provide information to allow the prediction of consumable usage and resource need.

The MIB supports printers that can contain more than one job at a time, but still be usable for low end printers that only contain a single job at a time. In particular, the MIB supports the needs of Windows and other PC environments for managing low-end direct-connect (serial or parallel) and networked devices without unnecessary overhead or complexity, while also providing for higher end systems and devices.

1.2 Types of Job Monitoring Applications

The Job Monitoring MIB is designed for the following types of monitoring applications:

1. Monitor a single job starting when the job is submitted and ending a defined period after the job completes. The Job Submission ID table provides the map to find the specific job to be monitored.
2. Monitor all 'active' jobs in a queue, which this specification generalizes to a "job set". End users may use such a program when selecting a least busy printer, so the MIB is designed for such a program to start up quickly and find the information needed quickly without having to read all (completed) jobs in order to find the active jobs. System operators may also use such a program, in which case it would be running for a long period of time and may also be interested in the jobs that have completed. Finally such a program may be used to provide an enhanced console and logging capability.
3. Collect resource usage for accounting or system utilization purposes that copy the completed job statistics to an accounting system. It is recognized that depending on accounting programs to copy MIB data during the job-retention period is somewhat unreliable, since the accounting program may not be running (or may have crashed). Such a program is also expected to keep a shadow copy of the entire Job Attribute table including completed, canceled, and aborted jobs which the program updates on each polling cycle. Such a program polls at the rate of the persistence of the Attribute table. The design is not optimized to help such an application determine which jobs are completed, canceled, or aborted. Instead, the application SHOULD query each job that the application's shadow copy shows was not complete, canceled, or aborted at the previous poll cycle to see if it is now complete or canceled, plus any new jobs that have been submitted.

The MIB provides a set of objects that represent a compatible subset of job and document attributes of the ISO DPA standard[iso-dpa] and the Internet Printing Protocol (IPP)[ipp-model], so that coherence is maintained between these two protocols and the information presented to end users and system operators by monitoring applications. However, the job monitoring MIB is intended to be used with printers that implement other job submitting and management protocols, such as IEEE 1284.1 (TIPSI)[tipsi], as well as with ones that do implement ISO DPA.

Thus the job monitoring MIB does not require implementation of either the ISO DPA or IPP protocols.

The MIB is designed so that an additional MIB(s) can be specified in the future for monitoring multi-function (scan, FAX, copy) jobs as an augmentation to this MIB.

2 Terminology and Job Model

This section defines the terms that are used in this specification and the general model for jobs in alphabetical order.

> NOTE - Existing systems use conflicting terms, so these terms are drawn from the ISO 10175 Document Printing Application (DPA) standard[iso-dpa]. For example, PostScript systems use the term *session* for what is called a *job* in this specification and the term *job* to mean what is called a *document* in this specification.

Accounting Application: The SNMP management application that copies job information to some more permanent medium so that another application can perform accounting on the data for Accountants, Asset Managers, and Capacity Planners use.

Agent: The network entity that accepts SNMP requests from a *monitor* or *accounting application* and provides access to the instrumentation for managing jobs modeled by the management objects defined in the Job Monitoring MIB module for a *server* or a *device*.

Attribute: A name, value-pair that specifies a job or document instruction, a status, or a condition of a job or a document that has been submitted to a server or device. A particular attribute NEED NOT be present in each job instance. In other words, attributes are present in a job instance only when there is a need to express the value, either because (1) the client supplied a value in the job submission protocol, (2) the document data contained an embedded attribute, or (3) the server or device supplied a default value. An agent MAY represent an attribute as an entry (row) in the Attribute table in this MIB in which entries are present only when necessary. Attributes are identified in this MIB by an enum.

Client: The network entity that *end users* use to submit jobs to *spoolers*, *servers*, or *printers* and other *devices*, depending on the configuration, using any job submission protocol over a serial or parallel port to a directly-connected device or over the network to a networked-connected device.

Device: A hardware entity that (1) interfaces to humans, such as a device that produces marks on paper or scans marks on paper to produce an electronic representation, (2) accesses digital media, such as CD-ROMs, or (3) interfaces electronically to another device, such as sends FAX data to another FAX device.

Document: A sub-section within a job that contains print data and *document instructions* that apply to just the document.

Document Instruction: An instruction specifying how to process the document. Document instructions MAY be passed in the job submission protocol separate from the actual document data, or MAY be embedded in the document data or a combination, depending on the job submission protocol and implementation.

End User: A user that uses a client to submit a print job. See "user".

Impression: For a print job, an impression is the passage of the entire side of a sheet by the marker, whether or not any marks are made and independent of the number of passes that the side makes past the marker. Thus a four pass color process counts as a single impression, as does highlight color. Impression counters count all kinds: monochrome, highlight color, and full process color, while full color counters only count full color impressions, and high light color counters only count high light color impressions.

One-sided processing involves one impression per sheet. Two-sided processing involves two impressions per sheet. If a two-sided document has an odd number of pages, the last sheet still counts as two impressions, if that sheet makes two passes through the marker or the marker marks on both sides of a sheet in a single pass. Two-up printing is the placement of two logical pages on one side of a sheet and so is still a single impression. See "page" and "sheet".

NOTE - Since impressions include blank sides, it is suggested that accounting application implementers consider charging for sheets, rather than impressions, possibly using the value of the sides attribute to select different charges for one-sided versus two-sided printing, since some users may think that impressions don’t include blank sides.

Internal Collation: The production of the sheets for each document copy performed within the printing device by making multiple passes over either the source or an intermediate representation of the document.

Job: A unit of work whose results are expected together without interjection of unrelated results. A job contains one or more *documents*.

Job Accounting: The activity of a management application of accessing the MIB and recording what happens to the job during and after the processing of the job.

Job Instruction: An instruction specifying how, when, or where the job is to be processed. Job instructions MAY be passed in the job submission protocol or MAY be embedded in the document data or a combination depending on the job submission protocol and implementation.

Job Monitoring (using SNMP): The activity of a management application of accessing the MIB and (1) identifying jobs in the job tables being processed by the server, printer or other devices, and (2) displaying information to the user about the processing of the job.

Job Monitoring Application: The SNMP management application that End Users, and System Operators use to monitor jobs using SNMP. A monitor MAY be either a separate application or MAY be part of the client that also submits jobs. See "monitor".

Job Set: A group of jobs that are queued and scheduled together according to a specified scheduling algorithm for a specified device or set of devices. For implementations that embed the SNMP agent in the device, the MIB job set normally represents *all* the jobs known to the device, so that the implementation only implements a single job set. If the SNMP agent is implemented in a server that controls one or more devices, each MIB job set represents a job queue for (1) a specific device or (2) set of devices, if the server uses a single queue to load balance between several devices. Each job set is disjoint; no job SHALL be represented in more than one MIB job set.

Monitor: Short for Job Monitoring Application.

Page: A page is a logical division of the original source document. Number up is the imposition of more than one page on a single side of a sheet. See "impression" and "sheet" and "two-up".

Proxy: An agent that acts as a concentrator for one or more other agents by accepting SNMP operations on the behalf of one or more other agents, forwarding them on to those other agents, gathering responses from those other agents and returning them to the original requesting monitor.

Queuing: The act of a *device* or *server* of ordering (queuing) the jobs for the purposes of scheduling the jobs to be processed.

Printer: A *device* that puts marks on media.

Server: A network entity that accepts jobs from clients and in turn submits the jobs to *printers* and other *devices* that may be directly connected to the server via a serial or parallel port or may be on the network. A server MAY be a printer *supervisor* control program, or a print *spooler*.

Sheet: A sheet is a single instance of a medium, whether printing on one or both sides of the medium. See "impression" and "page".

SNMP Information Object: A name, value-pair that specifies an action, a status, or a condition in an SNMP MIB. Objects are identified in SNMP by an OBJECT IDENTIFIER.

Spooler: A server that accepts jobs, spools the data, and decides when and on which printer to print the job. A spooler is a client to a printer or a printer supervisor, depending on implementation.

Spooling: The act of a *device* or *server* of (1) accepting jobs and (2) writing the job's attributes and document data on to secondary storage.

Stacked: When a media sheet is placed in an output bin of a device.

Supervisor: A server that contains a control program that controls a printer or other device. A supervisor is a client to the printer or other device.

System Operator: A user that uses a monitor to monitor the system and carries out tasks to keep the system running.

System Administrator: A user that specifies policy for the system.

Two-up: The placement of two pages on one side of a sheet so that each side or impressions counts as two pages. See "page" and "sheet".

User: A person that uses a client or a monitor. See "end user".

2.1 System Configurations for the Job Monitoring MIB

This section enumerates the three configurations in which the Job Monitoring MIB is intended to be used. To simplify the pictures, the *devices* are shown as *printers*. See section 1.1 entitled "Types of Information in the MIB".

The diagram in the Printer MIB[print-mib] entitled: "One Printer's View of the Network" is assumed for this MIB as well. Please refer to that diagram to aid in understanding the following system configurations.

2.1.1 Configuration 1 - client-printer

In the client-printer configuration 1, the client(s) submit jobs directly to the printer, either by some direct connect, or by network connection.

The job submitting client and/or monitoring application monitor jobs by communicating directly with an agent that is part of the printer. The agent in the printer SHALL keep the job in the Job Monitoring MIB as long as the job is in the printer, plus a defined time period after the job enters the completed state in which accounting programs can copy out the accounting data from the Job Monitoring MIB.

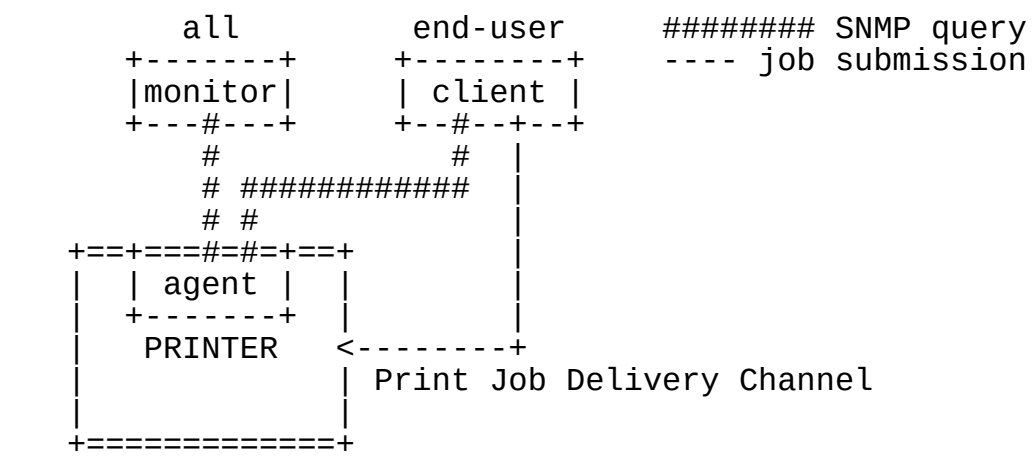

Figure 2-1 - Configuration 1 - client-printer - agent in the printer

The Job Monitoring MIB is designed to support the following relationships (not shown in Figure 2-1):

1. Multiple clients MAY submit jobs to a printer.
2. Multiple clients MAY monitor a printer.
3. Multiple monitors MAY monitor a printer.
4. A client MAY submit jobs to multiple printers.
5. A monitor MAY monitor multiple printers.

2.1.2 Configuration 2 - client-server-printer - agent in the server

In the client-server-printer configuration 2, the client(s) submit jobs to an intermediate server by some network connection, *not* directly to the printer. While configuration 2 is included, the design center for this MIB is configurations 1 and 3.

The job submitting client and/or monitoring application monitor jobs by communicating directly with:

A Job Monitoring MIB agent that is part of the server (or a front for the server)

There is no SNMP Job Monitoring MIB agent in the printer in configuration 2, at least that the client or monitor are aware. In this configuration, the agent SHALL return the current values of the objects in the Job Monitoring MIB both for jobs the server keeps and jobs that the server has submitted to the printer. The Job Monitoring MIB agent obtains the required information from the printer by a method that is beyond the scope of this document. The agent in the server SHALL keep the job in the Job Monitoring MIB in the server as long as the job is in the printer, plus a defined time period after the job enters the completed state in which accounting programs can copy out the accounting data from the Job Monitoring MIB.

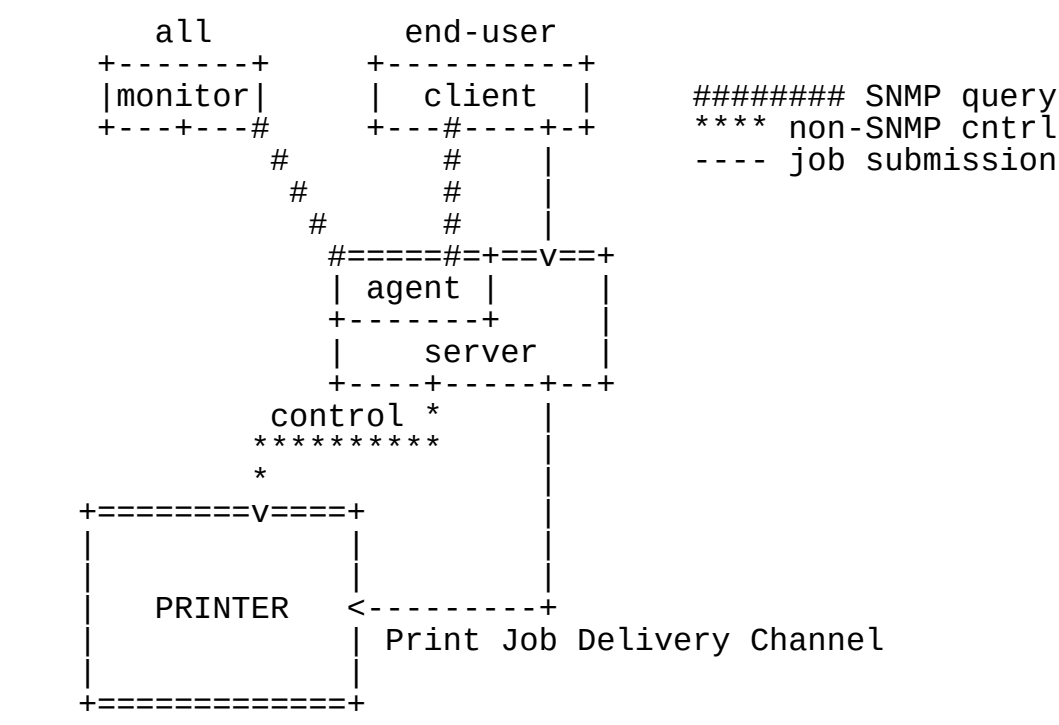

Figure 2-2 - Configuration 2 - client-server-printer - agent in the server

The Job Monitoring MIB is designed to support the following relationships (not shown in Figure 2-2):

1. Multiple clients MAY submit jobs to a server.
2. Multiple clients MAY monitor a server.
3. Multiple monitors MAY monitor a server.
4. A client MAY submit jobs to multiple servers.
5. A monitor MAY monitor multiple servers.
6. Multiple servers MAY submit jobs to a printer.
7. Multiple servers MAY control a printer.

2.1.3 Configuration 3 - client-server-printer - client monitors printer agent and server

In the client-server-printer configuration 3, the client(s) submit jobs to an intermediate server by some network connection, *not* directly to the printer. That server does *not* contain a Job Monitoring MIB agent.

The job submitting client and/or monitoring application monitor jobs by communicating directly with:

1. The server using some undefined protocol to monitor jobs in the server (that does not contain the Job Monitoring MIB) AND
2. A Job Monitoring MIB agent that is part of the printer to monitor jobs after the server passes the jobs to the printer.

In such configurations, the server deletes its copy of the job from the server after submitting the job to the printer usually almost immediately (before the job does much processing, if any).

In configuration 3, the agent (in the printer) SHALL keep the values of the objects in the Job Monitoring MIB that the agent implements updated for a job that the server has submitted to the printer. The agent SHALL obtain information about the jobs submitted to the printer from the server (either in the job submission protocol, in the document data, or by direct query of the server), in order to populate some of the objects the Job Monitoring MIB in the printer. The agent in the printer SHALL keep the job in the Job Monitoring MIB as long as the job is in the Printer, and longer in order to implement the completed state in which monitoring programs can copy out the accounting data from the Job Monitoring MIB.

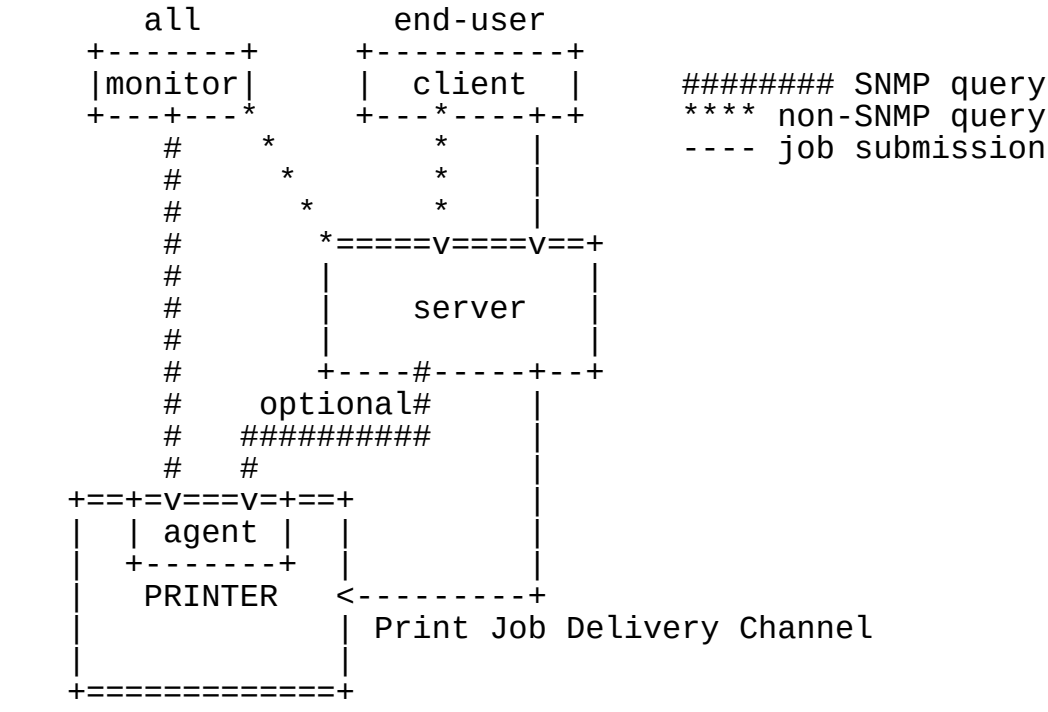

Figure 2-3 - Configuration 3 - client-server-printer - client monitors printer agent and server

The Job Monitoring MIB is designed to support the following relationships (not shown in Figure 2-3):

1. Multiple clients MAY submit jobs to a server.
2. Multiple clients MAY monitor a server.
3. Multiple monitors MAY monitor a server.
4. A client MAY submit jobs to multiple servers.
5. A monitor MAY monitor multiple servers.
6. Multiple servers MAY submit jobs to a printer.
7. Multiple servers MAY control a printer.

3 Managed Object Usage

This section describes the usage of the objects in the MIB.

3.1 Conformance Considerations

In order to achieve interoperability between job monitoring applications and job monitoring agents, this specification includes the conformance requirements for both monitoring applications and agents.

3.1.1 Conformance Terminology

This specification uses the verbs: "SHALL", "SHOULD", "MAY", and "NEED NOT" to specify conformance requirements according to RFC 2119 [req-words] as follows:

"SHALL": indicates an action that the subject of the sentence must implement in order to claim conformance to this specification

"MAY": indicates an action that the subject of the sentence does not have to implement in order to claim conformance to this specification, in other words that action is an implementation option

"NEED NOT": indicates an action that the subject of the sentence does not have to implement in order to claim conformance to this specification. The verb "NEED NOT" is used instead of "may not", since "may not" sounds like a prohibition.

"SHOULD": indicates an action that is recommended for the subject of the sentence to implement, but is not required, in order to claim conformance to this specification.

3.1.2 Agent Conformance Requirements

A conforming agent:

1. SHALL implement *all* MANDATORY groups in this specification.
2. SHALL implement any attributes if (1) the server or device supports the functionality represented by the attribute and (2) the information is available to the agent.
3. SHOULD implement both forms of an attribute if it implements an attribute that permits a choice of INTEGER and OCTET STRING forms, since implementing both forms may help management applications by giving them a choice of representations, since the representation are equivalent. See the JmAttributeTypeTC textual-convention.

NOTE - This MIB, like the Printer MIB, is written following the subset of SMIv2 that can be supported by SMIv1 and SNMPv1 implementations.

3.1.2.1 MIB II System Group objects

The Job Monitoring MIB agent SHALL implement all objects in the System Group of MIB-II[mib-II], whether the Printer MIB[print-mib] is implemented or not.

3.1.2.2 MIB II Interface Group objects

The Job Monitoring MIB agent SHALL implement all objects in the Interfaces Group of MIB-II[mib-II], whether the Printer MIB[print-mib] is implemented or not.

3.1.2.3 Printer MIB objects

If the agent is providing access to a device that is a printer, the agent SHALL implement all of the MANDATORY objects in the Printer MIB[print-mib] and all the objects in other MIBs that conformance to the Printer MIB requires, such as the Host Resources MIB[hr-mib]. If the agent is providing access to a server that controls one or more direct-connect or networked printers, the agent NEED NOT implement the Printer MIB and NEED NOT implement the Host Resources MIB.

3.1.3 Job Monitoring Application Conformance Requirements

A conforming job monitoring application:

1. SHALL accept the full syntactic range for all objects in all MANDATORY groups and all MANDATORY attributes that are required to be implemented by an agent according to Section 3.1.2 and SHALL either present them to the user or ignore them.
2. SHALL accept the full syntactic range for *all* attributes, including enum and bit values specified in this specification and additional ones that may be registered with the PWG and SHALL either present them to the user or ignore them. In particular, a conforming job monitoring application SHALL not malfunction when receiving any standard or registered enum or bit values. See Section 3.7 entitled "IANA and PWG Registration Considerations".
3. SHALL NOT fail when operating with agents that materialize attributes *after* the job has been submitted, as opposed to when the job is submitted.
4. SHALL, if it supports a time attribute, accept either form of the time attribute, since agents are free to implement either time form.

3.2 The Job Tables and the Oldest Active and Newest Active Indexes

The jmJobTable and jmAttributeTable contain objects and attributes, respectively, for each job in a job set. These first two indexes are:

1. jmGeneralJobSetIndex - which job set
2. jmJobIndex - which job in the job set

In order for a monitoring application to quickly find that active jobs (jobs in the pending, processing, or processingStopped states), the MIB contains two indexes:

1. jmGeneralOldestActiveJobIndex - the index of the active job that has been in the tables the longest.
2. jmGeneralNewestActiveJobIndex - the index of the active job that has been most recently added to the tables.

The agent SHALL assign the next incremental value of jmJobIndex to the job, when a new job is accepted by the server or device to which the agent is providing access. If the incremented value of jmJobIndex would exceed the implementation-defined maximum value for jmJobIndex, the agent SHALL 'wrap' back to 1. An agent uses the resulting value of jmJobIndex for storing information in the jmJobTable and the jmAttributeTable about the job.

It is recommended that the largest value for jmJobIndex be much larger than the maximum number of jobs that the implementation can contain at a single time, so as to minimize the premature re-use of a jmJobIndex value for a newer job while clients retain the same 'stale' value for an older job.

It is recommended that agents that are providing access to servers/devices that already allocate job-identifiers for jobs as integers use the same integer value for the jmJobIndex. Then management applications using this MIB and applications using other protocols will see the same job identifiers for the same jobs. Agents providing access to systems that contain jobs with a job identifier of 0 SHALL map the job identifier value 0 to a jmJobIndex value that is one higher than the highest job identifier value that any job can have on that system. Then only job 0 will have a different job-identifier value than the job's jmJobIndex value.

NOTE - If a server or device accepts jobs using multiple job submission protocols, it may be difficult for the agent to meet the recommendation to use the job-identifier values that the server or device assigns as the jmJobIndex value, unless the server/device assigns job-identifiers for each of its job submission protocols from the same job-identifier number space.

Each time a new job is accepted by the server or device that the agent is providing access to AND that job is to be 'active' (pending, processing, or processingStopped, but not pendingHeld), the agent SHALL copy the value of the job's jmJobIndex to the jmGeneralNewestActiveJobIndex object. If the new job is to be 'inactive' (pendingHeld state), the agent SHALL not change the value of jmGeneralNewestActiveJobIndex object (though the agent SHALL assign the next incremental jmJobIndex value to the job).

When a job transitions from one of the 'active' job states (pending, processing, processingStopped) to one of the 'inactive' job states (pendingHeld, completed, canceled, or aborted), with a jmJobIndex value that matches the jmGeneralOldestActiveJobIndex object, the agent SHALL advance (or wrap) the value to the next oldest 'active' job, if any. See the JmJobStateTC textual-convention for a definition of the job states.

Whenever a job transitions from one of the 'inactive' job states to one of the 'active' job states (from pendingHeld to pending or processing), the agent SHALL update the value of either the jmGeneralOldestActiveJobIndex or the jmGeneralNewestActiveJobIndex objects, or both, if the job's jmJobIndex value is outside the range between jmGeneralOldestActiveJobIndex and jmGeneralNewestActiveJobIndex.

When all jobs become 'inactive', i.e., enter the pendingHeld, completed, canceled, or aborted states, the agent SHALL set the value of both the jmGeneralOldestActiveJobIndex and jmGeneralNewestActiveJobIndex objects to 0.

NOTE - Applications that wish to efficiently access all of the active jobs MAY use jmGeneralOldestActiveJobIndex value to start with the oldest active job and continue until they reach the index value equal to jmGeneralNewestActiveJobIndex, skipping over any pendingHeld, completed, canceled, or aborted jobs that might intervene.

If an application detects that the jmGeneralNewestActiveJobIndex is smaller than jmGeneralOldestActiveJobIndex, the job index has wrapped. In this case, the application SHALL reset the index to 1 when the end of the table is reached and continue the GetNext operations to find the rest of the active jobs.

NOTE - Applications detect the end of the jmAttributeTable table when the OID returned by the GetNext operation is an OID in a different MIB. There is no object in this MIB that specifies the maximum value for the jmJobIndex supported by the implementation.

When the server or device is power-cycled, the agent SHALL remember the next jmJobIndex value to be assigned, so that new jobs are not assigned the same jmJobIndex as recent jobs before the power cycle.

3.3 The Attribute Mechanism

Attributes are similar to information objects, except that attributes are identified by an enum, instead of an OID, so that attributes may be registered without requiring a new MIB. Also an implementation that does not have the functionality represented by the attribute can omit the attribute entirely, rather than having to return a distinguished value. The agent is free to materialize an attribute in the jmAttributeTable as soon as the agent is aware of the value of the attribute.

The agent materializes job attributes in a four-indexed jmAttributeTable:

1. jmGeneralJobSetIndex - which job set
2. jmJobIndex - which job in the job set
3. jmAttributeTypeIndex - which attribute
4. jmAttributeInstanceIndex - which attribute instance for those attributes that can have multiple values per job.

Some attributes represent information about a job, such as a file-name, a document-name, a submission-time or a completion time. Other attributes represent resources required, e.g., a medium or a colorant, etc. to process the job before the job starts processing OR to indicate the amount of the resource consumed during and after processing, e.g., pages completed or impressions completed. If both a required and a consumed value of a resource is needed, this specification assigns two separate attribute enums in the textual convention.

NOTE - The table of contents lists all the attributes in order. This order is the order of enum assignments which is the order that the SNMP GetNext operation returns attributes. Most attributes apply to all three configurations covered by this MIB specification (see section 2.1 entitled "System Configurations for the Job Monitoring MIB"). Those attributes that apply to a particular configuration are indicated as 'Configuration *n*:' and SHALL NOT be used with other configurations.

3.3.1 Conformance of Attribute Implementation

An agent SHALL implement any attribute if (1) the server or device supports the functionality represented by the attribute and (2) the information is available to the agent. The agent MAY create the attribute row in the jmAttributeTable when the information is available or MAY create the row earlier with the designated 'unknown' value appropriate for that attribute. See next section.

If the server or device does not implement or does not provide access to the information about an attribute, the agent SHOULD NOT create the corresponding row in the jmAttributeTable.

3.3.2 Useful, 'Unknown', and 'Other' Values for Objects and Attributes

Some attributes have a 'useful' Integer32 value, some have a 'useful' OCTET STRING value, some MAY have either or both depending on implementation, and some MUST have both. See the JmAttributeTypeTC textual convention for the specification of each attribute.

SNMP requires that if an object cannot be implemented because its values cannot be accessed, then a compliant agent SHALL return an SNMP error in SNMPv1 or an exception value in SNMPv2. However, this MIB has been designed so that 'all' objects can and SHALL be implemented by an agent, so that neither the SNMPv1 error nor the SNMPv2 exception value SHALL be generated by the agent. This MIB has also been designed so that when an agent materializes an attribute, the agent SHALL materialize a row consisting of both the jmAttributeValueAsInteger and jmAttributeValueAsOctets objects.

In general, values for objects and attributes have been chosen so that a management application will be able to determine whether a 'useful', 'unknown', or 'other' value is available. When a useful value is not available for an object, that agent SHALL return a zero-length string for octet strings, the value 'unknown(2)' for enums, a '0' value for an object that represents an index in another table, and a value '-2' for counting integers.

Since each attribute is represented by a row consisting of both the jmAttributeValueAsInteger and jmAttributeValueAsOctets MANDATORY objects, SNMP requires that the agent SHALL always create an attribute row with both objects specified. However, for most attributes the agent SHALL return a "useful" value for one of the objects and SHALL return the 'other' value for the other object. For integer only attributes, the agent SHALL always return a zero-length string value for the jmAttributeValueAsOctets object. For octet string only attributes, the agent SHALL always return a '-1' value for the jmAttributeValueAsInteger object.

3.3.3 Index Value Attributes

A number of attributes are indexes in other tables. Such attribute names end with the word 'Index'. If the agent has not (yet) assigned an index value for a particular index attribute for a job, the agent SHALL either: (1) return the value 0 or (2) *not* add this attribute to the jmAttributeTable until the index value is assigned. In the interests of brevity, the semantics for 0 is specified once here and is *not* repeated for each index attribute specification and a DEFVAL of 0 is implied, even though the DEFVAL for jmAttributeValueAsInteger is -2.

3.3.4 Data Sub-types and Attribute Naming Conventions

Many attributes are sub-typed to give a more specific data type than Integer32 or OCTET STRING. The data sub-type of each attribute is indicated on the first line(s) of the description. Some attributes have several different data sub-type representations. When an attribute has both an Integer32 data sub-type and an OCTET STRING data sub-type, the attribute can be represented in a single row in the jmAttributeTable. In this case, the data sub-type name is not included as the last part of the name of the attribute, e.g., documentFormat(38) which is both an enum and/or a name. When the data sub-types cannot be represented by a single row in the jmAttributeTable, each such representation is considered a separate attribute and is assigned a separate name and enum value. For these attributes, the name of the data sub-type is the last part of the name of the attribute: Name, Index, DateAndTime, TimeStamp, etc. For example, documentFormatIndex(37) is an index.

NOTE: The Table of Contents also lists the data sub-type and/or data sub-types of each attribute, using the textual-convention name when such is defined. The following abbreviations are used in the Table of Contents as shown:

'Int32(-2..)'	Integer32 (-2..2147483647)
'Int32(0..)'	Integer32 (0..2147483647)
'Int32(1..)'	Integer32 (1..2147483647)
'Int32(m..n)'	For all other Integer ranges, the lower and upper bound of the range is indicated.
'UTF8String63'	JmUTF8StringTC (SIZE(0..63))
'JobString63'	JmJobStringTC (SIZE(0..63))
'Octets63'	OCTET STRING (SIZE(0..63))
'Octets(m..n)'	For all other OCTET STRING ranges, the exact range is indicated.

3.3.5 Single-Value (Row) Versus Multi-Value (MULTI-ROW) Attributes

Most attributes have only one row per job. However, a few attributes can have multiple values per job or even per document, where each value is a separate row in the jmAttributeTable. Unless indicated with 'MULTI-ROW:' in the JmAttributeTypeTC description, an agent SHALL ensure that each attribute occurs only once in the jmAttributeTable for a job. Most of the 'MULTI-ROW' attributes do not allow duplicate values, i.e., the agent SHALL ensure that each value occurs only once for a job. Only if the specification of the 'MULTI-ROW' attribute also says "There is no restriction on the same xxx occurring in multiple rows" can the agent allow duplicate values to occur for the job.

NOTE - Duplicates are allowed for 'extensive' 'MULTI-ROW' attributes, such as fileName(34) or documentName(35) which are specified to be 'per-document' attributes, but are *not* allowed for 'intensive' 'MULTI-ROW' attributes, such as mediumConsumed(171) and documentFormat(38) which are specified to be 'per-job' attributes.

3.3.6 Requested Objects and Attributes

A number of objects and attributes record requirements for the job. Such object and attribute names end with the word 'Requested'. In the interests of brevity, the phrase 'requested' means: (1) requested by the client (or intervening server) in the job submission protocol and may also mean (2) embedded in the submitted document data, and/or (3) defaulted by the recipient device or server with the same semantics as if the requester had supplied, depending on implementation. Also if a value is supplied by the job submission client, and the server/device determines a better value, through processing or other means, the agent MAY return that better value for such object and attribute.

3.3.7 Consumption Attributes

A number of objects and attributes record consumption. Such attribute names end with the word 'Completed' or 'Consumed'. If the job has not yet consumed what that resource is metering, the agent either: (1) SHALL return the value 0 or (2) SHALL *not* add this attribute to the jmAttributeTable until the consumption begins. In the interests of brevity, the semantics for 0 is specified once here and is *not* repeated for each consumption attribute specification and a DEFVAL of 0 is implied, even though the DEFVAL for jmAttributeValueAsInteger is -2.

3.3.8 Attribute Specifications

This section specifies the job attributes.

In the following definitions of the attributes, each description indicates whether the useful value of the attribute SHALL be represented using the jmAttributeValueAsInteger or the jmAttributeValueAsOctets objects by the initial tag: 'INTEGER:' or 'OCTETS:', respectively.

Some attributes allow the agent implementer a choice of useful values of either an integer, an octets representation, or both, depending on implementation. These attributes are indicated with 'INTEGER:' AND/OR 'OCTETS:' tags.

A very few attributes require both objects at the same time to represent a pair of useful values (see mediumConsumed(171)). These attributes are indicated with 'INTEGER:' AND 'OCTETS:' tags. See the jmAttributeGroup for the descriptions of these two MANDATORY objects.

NOTE - The enum assignments are grouped logically with values assigned in groups of 20, so that additional values may be registered in the future and assigned a value that is part of their logical grouping.

Values in the range 2**30 to 2**31-1 are reserved for private or experimental usage. This range corresponds to the same range reserved in IPP. Implementers are warned that use of such values may conflict with other implementations. Implementers are encouraged to request registration of enum values following the procedures in Section 3.7.1.

NOTE: No attribute name exceeds 31 characters.

The standard attribute types are:

jmAttributeTypeIndex	Datatype
other(1),	Integer32 (-2..2147483647) AND/OR OCTET STRING(SIZE(0..63))
INTEGER: and/or OCTETS: An attribute that is not in the list and/or that has not been approved and registered with the PWG.	

```
        ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
        + Job State attributes
        +
        + The following attributes specify the state of a job.
        ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

        jobStateReasons2(3),              JmJobStateReasons2TC
            INTEGER:  Additional information about the job's current
            state that augments the jmJobState object.  See the
            description under the JmJobStateReasons1TC textual-
            convention.

        jobStateReasons3(4),              JmJobStateReasons3TC
            INTEGER:  Additional information about the job's current
            state that augments the jmJobState object.  See the
            description under JmJobStateReasons1TC textual-convention.

        jobStateReasons4(5),              JmJobStateReasons4TC
            INTEGER:  Additional information about the job's current
            state that augments the jmJobState object.  See the
            description under JmJobStateReasons1TC textual-convention.

        processingMessage(6),             JmUTF8StringTC (SIZE(0..63))
            OCTETS:  MULTI-ROW:  A coded character set message that is
            generated by the server or device during the processing of
            the job as a simple form of processing log to show progress
            and any problems.  The natural language of each value is
            specified by the corresponding
            processingMessageNaturalLangTag(7) value.

            NOTE - This attribute is intended for such conditions as
            interpreter messages, rather than being the printable form
            of the jmJobState and jmJobStateReasons1 objects and
            jobStateReasons2, jobStateReasons3, and jobStateReasons4
            attributes.  In order to produce a localized printable form
            of these job state objects/attribute, a management
            application SHOULD produce a message from their enum and
            bit values.

            NOTE - There is no job description attribute in IPP/1.0
            that corresponds to this attribute and this attribute does
            not correspond to the IPP/1.0 'job-state-message' job
            description attribute, which is just a printable form of
            the IPP 'job-state' and 'job-state-reasons' job attributes.

            There is no restriction for the same message occurring in
            multiple rows.
```

processingMessageNaturalLangTag(7), OCTET STRING(SIZE(0..63))
OCTETS: MULTI-ROW: The natural language of the corresponding processingMessage(6) attribute value. See section 3.6.1, entitled 'Text generated by the server or device'.

If the agent does not know the natural language of the job processing message, the agent SHALL either (1) return a zero length string value for the processingMessageNaturalLangTag(7) attribute or (2) not return the processingMessageNaturalLangTag(7) attribute for the job.

There is no restriction for the same tag occurring in multiple rows, since when this attribute is implemented, it SHOULD have a value row for each corresponding processingMessage(6) attribute value row.

jobCodedCharSet(8), CodedCharSet
INTEGER: The MIBenum identifier of the coded character set that the agent is using to represent coded character set objects and attributes of type 'JmJobStringTC'. These coded character set objects and attributes are either: (1) supplied by the job submitting client or (2) defaulted by the server or device when omitted by the job submitting client. The agent SHALL represent these objects and attributes in the MIB either (1) in the coded character set as they were submitted or (2) MAY convert the coded character set to another coded character set or encoding scheme as identified by the jobCodedCharSet(8) attribute. See section 3.6.2, entitled 'Text supplied by the job submitter'.

These MIBenum values are assigned by IANA [IANA-charsets] when the coded character sets are registered. The coded character set SHALL be one of the ones registered with IANA [IANA] and the enum value uses the CodedCharSet textual-convention from the Printer MIB. See the JmJobStringTC textual-convention.

If the agent does not know what coded character set was used by the job submitting client, the agent SHALL either (1) return the 'unknown(2)' value for the jobCodedCharSet(8) attribute or (2) not return the jobCodedCharSet(8) attribute for the job.

```
        jobNaturalLanguageTag(9),          OCTET STRING(SIZE(0..63))
            OCTETS: The natural language of the job attributes supplied
            by the job submitter or defaulted by the server or device
            for the job, i.e., all objects and attributes represented
            by the 'JmJobStringTC' textual-convention, such as jobName,
            mediumRequested, etc.  See Section 3.6.2, entitled 'Text
            supplied by the job submitter'.

            If the agent does not know what natural language was used
            by the job submitting client, the agent SHALL either (1)
            return a zero length string value for the
            jobNaturalLanguageTag(9) attribute or (2) not return
            jobNaturalLanguageTag(9)  attribute for the job.

        ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
        + Job Identification attributes
        +
        + The following attributes help an end user, a system
        + operator, or an accounting program identify a job.
        ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

        jobURI(20),                        OCTET STRING(SIZE(0..63))
            OCTETS:  MULTI-ROW:  The job's Universal Resource
            Identifier (URI) [RFC-1738].  See IPP [ipp-model] for
            example usage.

            NOTE - The agent may be able to generate this value on each
            SNMP Get operation from smaller values, rather than having
            to store the entire URI.

            If the URI exceeds 63 octets, the agent SHALL use multiple
            values, with the next 63 octets coming in the second value,
            etc.

            NOTE - IPP [ipp-model] has a 1023-octet maximum length for
            a URI, though the URI standard itself and HTTP/1.1 specify
            no maximum length.

        jobAccountName(21),                OCTET STRING(SIZE(0..63))
            OCTETS:  Arbitrary binary information which MAY be coded
            character set data or encrypted data supplied by the
            submitting user for use by accounting services to allocate
            or categorize charges for services provided, such as a
            customer account name or number.

            NOTE: This attribute NEED NOT be printable characters.
```

serverAssignedJobName(22), JmJobStringTC (SIZE(0..63))
OCTETS: Configuration 3 only: The human readable string name, number, or ID of the job as assigned by the server that submitted the job to the device that the agent is providing access to with this MIB.

NOTE - This attribute is intended for enabling a user to find his/her job that a server submitted to a device when either the client does not support the jmJobSubmissionID or the server does not pass the jmJobSubmissionID through to the device.

jobName(23), JmJobStringTC (SIZE(0..63))
OCTETS: The human readable string name of the job as assigned by the submitting user to help the user distinguish between his/her various jobs. This name does not need to be unique.

This attribute is intended for enabling a user or the user's application to convey a job name that MAY be printed on a start sheet, returned in a query result, or used in notification or logging messages.

In order to assist users to find their jobs for job submission protocols that don't supply a jmJobSubmissionID, the agent SHOULD maintain the jobName attribute for the time specified by the jmGeneralJobPersistence object, rather than the (shorter) jmGeneralAttributePersistence object.

If this attribute is not specified when the job is submitted, no job name is assumed, but implementation specific defaults are allowed, such as the value of the documentName attribute of the first document in the job or the fileName attribute of the first document in the job.

The jobName attribute is distinguished from the jobComment attribute, in that the jobName attribute is intended to permit the submitting user to distinguish between different jobs that he/she has submitted. The jobComment attribute is intended to be free form additional information that a user might wish to use to communicate with himself/herself, such as a reminder of what to do with the results or to indicate a different set of input parameters were tried in several different job submissions.

jobServiceTypes(24), JmJobServiceTypesTC
INTEGER: Specifies the type(s) of service to which the job has been submitted (print, fax, scan, etc.). The service type is bit encoded with each job service type so that more general and arbitrary services can be created, such as services with more than one destination type, or ones with only a source or only a destination. For example, a job service might scan, faxOut, and print a single job. In this case, three bits would be set in the jobServiceTypes attribute, corresponding to the hexadecimal values: 0x8 + 0x20 + 0x4, respectively, yielding: 0x2C.

Whether this attribute is set from a job attribute supplied by the job submission client or is set by the recipient job submission server or device depends on the job submission protocol. This attribute SHALL be implemented if the server or device has other types in addition to or instead of printing.

One of the purposes of this attribute is to permit a requester to filter out jobs that are not of interest. For example, a printer operator may only be interested in jobs that include printing.

jobSourceChannelIndex(25), Integer32 (0..2147483647)
INTEGER: The index of the row in the associated Printer MIB[print-mib] of the channel which is the source of the print job.

jobSourcePlatformType(26), JmJobSourcePlatformTypeTC
INTEGER: The source platform type of the immediate upstream submitter that submitted the job to the server (configuration 2) or device (configuration 1 and 3) to which the agent is providing access. For configuration 1, this is the type of the client that submitted the job to the device; for configuration 2, this is the type of the client that submitted the job to the server; and for configuration 3, this is the type of the server that submitted the job to the device.

submittingServerName(27), JmJobStringTC (SIZE(0..63))
OCTETS: For configuration 3 only: The administrative name of the server that submitted the job to the device.

submittingApplicationName(28), JmJobStringTC (SIZE(0..63))
OCTETS: The name of the client application (not the server in configuration 3) that submitted the job to the server or device.

jobOriginatingHost(29), JmJobStringTC (SIZE(0..63))
OCTETS: The name of the client host (not the server host name in configuration 3) that submitted the job to the server or device.

deviceNameRequested(30), JmJobStringTC (SIZE(0..63))
OCTETS: The administratively defined coded character set name of the target device requested by the submitting user. For configuration 1, its value corresponds to the Printer MIB[print-mib]: prtGeneralPrinterName object. For configuration 2 and 3, its value is the name of the logical or physical device that the user supplied to indicate to the server on which device(s) they wanted the job to be processed.

queueNameRequested(31), JmJobStringTC (SIZE(0..63))
OCTETS: The administratively defined coded character set name of the target queue requested by the submitting user. For configuration 1, its value corresponds to the queue in the device for which the agent is providing access. For configuration 2 and 3, its value is the name of the queue that the user supplied to indicate to the server on which device(s) they wanted the job to be processed.

NOTE - typically an implementation SHOULD support either the deviceNameRequested or queueNameRequested attribute, but not both.

physicalDevice(32), hrDeviceIndex
AND/OR
JmUTF8StringTC (SIZE(0..63))
INTEGER: MULTI-ROW: The index of the physical device MIB instance requested/used, such as the Printer MIB[print-mib]. This value is an hrDeviceIndex value. See the Host Resources MIB[hr-mib].

AND/OR

OCTETS: MULTI-ROW: The name of the physical device to which the job is assigned.

numberOfDocuments(33), Integer32 (-2..2147483647)
INTEGER: The number of documents in this job.

The agent SHOULD return this attribute if the job has more than one document.

fileName(34), JmJobStringTC (SIZE(0..63))
OCTETS: MULTI-ROW: The coded character set file name or URI[URI-spec] of the document.

There is no restriction on the same file name occurring in multiple rows.

documentName(35), JmJobStringTC (SIZE(0..63))
OCTETS: MULTI-ROW: The coded character set name of the document.

There is no restriction on the same document name occurring in multiple rows.

jobComment(36), JmJobStringTC (SIZE(0..63))
OCTETS: An arbitrary human-readable coded character text string supplied by the submitting user or the job submitting application program for any purpose. For example, a user might indicate what he/she is going to do with the printed output or the job submitting application program might indicate how the document was produced.

The jobComment attribute is not intended to be a name; see the jobName attribute.

documentFormatIndex(37), Integer32 (0..2147483647)
INTEGER: MULTI-ROW: The index in the prtInterpreterTable in the Printer MIB[print-mib] of the page description language (PDL) or control language interpreter that this job requires/uses. A document or a job MAY use more than one PDL or control language.

NOTE - As with all intensive attributes where multiple rows are allowed, there SHALL be only one distinct row for each distinct interpreter; there SHALL be no duplicates.

NOTE - This attribute type is intended to be used with an agent that implements the Printer MIB and SHALL not be used if the agent does not implement the Printer MIB. Such an agent SHALL use the documentFormat attribute instead.

```
1224          documentFormat(38),                PrtInterpreterLangFamilyTC
1225                                             AND/OR
1226                                             OCTET STRING(SIZE(0..63))
1227              INTEGER:  MULTI-ROW:  The interpreter language family
1228              corresponding to the Printer MIB[print-mib]
1229              prtInterpreterLangFamily object, that this job
1230              requires/uses.  A document or a job MAY use more than one
1231              PDL or control language.
1232
1233              AND/OR
1234
1235              OCTETS:  MULTI-ROW:  The document format registered as a
1236              media type[iana-media-types], i.e., the name of the MIME
1237              content-type/subtype.  Examples: 'application/postscript',
1238              'application/vnd.hp-PCL', 'application/pdf', 'text/plain'
1239              (US-ASCII SHALL be assumed), 'text/plain; charset=iso-8859-
1240              1', and 'application/octet-stream'.  The IPP 'document-
1241              format' job attribute uses these same values with the same
1242              semantics.  See the IPP [ipp-model] 'mimeMediaType'
1243              attribute syntax and the document-format attribute for
1244              further examples and explanation.
1245
1246          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1247          + Job Parameter attributes
1248          +
1249          + The following attributes represent input parameters
1250          + supplied by the submitting client in the job submission
1251          + protocol.
1252          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1253
1254          jobPriority(50),                   Integer32 (-2..100)
1255              INTEGER:  The priority for scheduling the job.  It is used
1256              by servers and devices that employ a priority-based
1257              scheduling algorithm.
1258
1259              A higher value specifies a higher priority.  The value 1 is
1260              defined to indicate the lowest possible priority (a job
1261              which a priority-based scheduling algorithm SHALL pass over
1262              in favor of higher priority jobs).  The value 100 is
1263              defined to indicate the highest possible priority.
1264              Priority is expected to be evenly or 'normally' distributed
1265              across this range.  The mapping of vendor-defined priority
1266              over this range is implementation-specific.  -2 indicates
1267              unknown.
1268
```

jobProcessAfterDateAndTime(51), DateAndTime (SNMPv2-TC)
OCTETS: The calendar date and time of day after which the job SHALL become a candidate to be scheduled for processing. If the value of this attribute is in the future, the server SHALL set the value of the job's jmJobState object to pendingHeld and add the jobProcessAfterSpecified bit value to the job's jmJobStateReasons1 object. When the specified date and time arrives, the server SHALL remove the jobProcessAfterSpecified bit value from the job's jmJobStateReasons1 object and, if no other reasons remain, SHALL change the job's jmJobState object to pending.

jobHold(52), JmBooleanTC
INTEGER: If the value is 'true(4)', a client has explicitly specified that the job is to be held until explicitly released. Until the job is explicitly released by a client, the job SHALL be in the pendingHeld state with the jobHoldSpecified value in the jmJobStateReasons1 attribute.

jobHoldUntil(53), JmJobStringTC (SIZE(0..63))
OCTETS: The named time period during which the job SHALL become a candidate for processing, such as 'evening', 'night', 'weekend', 'second-shift', 'third-shift', etc., (supported values configured by the system administrator). See IPP [ipp-model] for the standard keyword values. Until that time period arrives, the job SHALL be in the pendingHeld state with the jobHoldUntilSpecified value in the jmJobStateReasons1 object. The value 'no-hold' SHALL indicate explicitly that no time period has been specified; the absence of this attribute SHALL indicate implicitly that no time period has been specified.

outputBin(54), Integer32 (0..2147483647)
AND/OR
JmJobStringTC (SIZE(0..63))
INTEGER: MULTI-ROW: The output subunit index in the Printer MIB[print-mib]

AND/OR

OCTETS: MULTI-ROW: the name or number (represented as ASCII digits) of the output bin to which all or part of the job is placed in.

```
1315          sides(55),                          Integer32 (-2..2)
1316              INTEGER:  MULTI-ROW:  The number of sides, '1' or '2', that
1317              any document in this job requires/used.
1318
1319          finishing(56),                      JmFinishingTC
1320              INTEGER:  MULTI-ROW:  Type of finishing that any document
1321              in this job requires/used.
1322
1323
1324          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1325          + Image Quality attributes (requested and consumed)
1326          +
1327          + For devices that can vary the image quality.
1328          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1329
1330          printQualityRequested(70),          JmPrintQualityTC
1331              INTEGER:  MULTI-ROW:  The print quality selection requested
1332              for a document in the job for printers that allow quality
1333              differentiation.
1334
1335          printQualityUsed(71),               JmPrintQualityTC
1336              INTEGER:  MULTI-ROW:  The print quality selection actually
1337              used by a document in the job for printers that allow
1338              quality differentiation.
1339
1340          printerResolutionRequested(72),     JmPrinterResolutionTC
1341              OCTETS:  MULTI-ROW:  The printer resolution requested for a
1342              document in the job for printers that support resolution
1343              selection.
1344
1345          printerResolutionUsed(73),          JmPrinterResolutionTC
1346              OCTETS:  MULTI-ROW:  The printer resolution actually used
1347              by a document in the job for printers that support
1348              resolution selection.
1349
1350          tonerEcomonyRequested(74),          JmTonerEconomyTC
1351              INTEGER:  MULTI-ROW:  The toner economy selection requested
1352              for documents in the job for printers that allow toner
1353              economy differentiation.
1354
1355          tonerEcomonyUsed(75),               JmTonerEconomyTC
1356              INTEGER:  MULTI-ROW:  The toner economy selection actually
1357              used by documents in the job for printers that allow toner
1358              economy differentiation.
1359
1360          tonerDensityRequested(76)           Integer32 (-2..100)
1361              INTEGER:  MULTI-ROW:  The toner density requested for a
1362              document in this job for devices that can vary toner
1363              density levels.  Level 1 is the lowest density and level
1364              100 is the highest density level.  Devices with a smaller
1365              range, SHALL map the 1-100 range evenly onto the
1366              implemented range.
```

```
1367
1368          tonerDensityUsed(77),              Integer32 (-2..100)
1369              INTEGER:  MULTI-ROW:  The toner density used by documents
1370              in this job for devices that can vary toner density levels.
1371              Level 1 is the lowest density and level 100 is the highest
1372              density level.  Devices with a smaller range, SHALL map the
1373              1-100 range evenly onto the implemented range.
1374
1375          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1376          + Job Progress attributes (requested and consumed)
1377          +
1378          + Pairs of these attributes can be used by monitoring
1379          + applications to show an indication of relative progress
1380          + to users.  See section 3.4, entitled  'Monitoring Job
1381          Progress'.
1382          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1383
1384          jobCopiesRequested(90),            Integer32 (-2..2147483647)
1385              INTEGER:  The number of copies of the entire job that are
1386              to be produced.
1387
1388          jobCopiesCompleted(91),            Integer32 (-2..2147483647)
1389              INTEGER:  The number of copies of the entire job that have
1390              been completed so far.
1391
1392          documentCopiesRequested(92),       Integer32 (-2..2147483647)
1393              INTEGER:  The total count of the number of document copies
1394              requested for the job as a whole.  If there are documents
1395              A, B, and C, and document B is specified to produce 4
1396              copies, the number of document copies requested is 6 for
1397              the job.
1398
1399              This attribute SHALL be used only when a job has multiple
1400              documents.  The jobCopiesRequested attribute SHALL be used
1401              when the job has only one document.
1402
1403          documentCopiesCompleted(93),       Integer32 (-2..2147483647)
1404              INTEGER:  The total count of the number of document copies
1405              completed so far for the job as a whole.  If there are
1406              documents A, B, and C, and document B is specified to
1407              produce 4 copies, the number of document copies starts a 0
1408              and runs up to 6 for the job as the job processes.
1409
1410              This attribute SHALL be used only when a job has multiple
1411              documents.  The jobCopiesCompleted attribute SHALL be used
1412              when the job has only one document.
1413
```

```
1414          jobKOctetsTransferred(94),        Integer32 (-2..2147483647)
1415              INTEGER:  The number of K (1024) octets transferred to the
1416              server or device to which the agent is providing access.
1417              This count is independent of the number of copies of the
1418              job or documents that will be produced, but it is only a
1419              measure of the number of bytes transferred to the server or
1420              device.
1421
1422              The agent SHALL round the actual number of octets
1423              transferred up to the next higher K.  Thus 0 octets SHALL
1424              be represented as '0', 1-1024 octets SHALL BE represented
1425              as '1', 1025-2048 SHALL be '2', etc.  When the job
1426              completes, the values of the jmJobKOctetsPerCopyRequested
1427              object and the jobKOctetsTransferred attribute SHALL be
1428              equal.
1429
1430              NOTE - The jobKOctetsTransferred can be used with the
1431              jmJobKOctetsPerCopyRequested object in order to produce a
1432              relative indication of the progress of the job for agents
1433              that do not implement the jmJobKOctetsProcessed object.
1434
1435          sheetCompletedCopyNumber(95),     Integer32 (-2..2147483647)
1436              INTEGER:  The number of the copy being stacked for the
1437              current document.  This number starts at 0, is set to 1
1438              when the first sheet of the first copy for each document is
1439              being stacked and is equal to n where n is the nth sheet
1440              stacked in the current document copy.  See section 3.4 ,
1441              entitled 'Monitoring Job Progress'.
1442
1443          sheetCompletedDocumentNumber(96), Integer32 (-2..2147483647)
1444              INTEGER:  The ordinal number of the document in the job
1445              that is currently being stacked.  This number starts at 0,
1446              increments to 1 when the first sheet of the first document
1447              in the job is being stacked, and is equal to n where n is
1448              the nth document in the job, starting with 1.
1449
1450              Implementations that only support one document jobs SHOULD
1451              NOT implement this attribute.
1452
1453          jobCollationType(97),             JmJobCollationTypeTC
1454              INTEGER:  The type of job collation. See also Section 3.4,
1455              entitled 'Monitoring Job Progress'.
1456
```

```
1457          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1458          + Impression attributes
1459          +
1460          + See the definition of the terms 'impression', 'sheet',
1461          + and 'page' in Section 2.
1462          +
1463          + See also jmJobImpressionsPerCopyRequested and
1464          + jmJobImpressionsCompleted objects in the jmJobTable.
1465          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1466
1467          impressionsSpooled(110),          Integer32 (-2..2147483647)
1468              INTEGER:  The number of impressions spooled to the server
1469              or device for the job so far.
1470
1471          impressionsSentToDevice(111),     Integer32 (-2..2147483647)
1472              INTEGER:  The number of impressions sent to the device for
1473              the job so far.
1474
1475          impressionsInterpreted(112),      Integer32 (-2..2147483647)
1476              INTEGER:  The number of impressions interpreted for the job
1477              so far.
1478
1479          impressionsCompletedCurrentCopy(113),
1480                                            Integer32 (-2..2147483647)
1481              INTEGER:  The number of impressions completed by the device
1482              for the current copy of the current document so far.  For
1483              printing, the impressions completed includes interpreting,
1484              marking, and stacking the output.  For other types of job
1485              services, the number of impressions completed includes the
1486              number of impressions processed.
1487
1488              This value SHALL be reset to 0 for each document in the job
1489              and for each document copy.
1490
1491          fullColorImpressionsCompleted(114), Integer32 (-2..2147483647)
1492              INTEGER:  The number of full color impressions completed by
1493              the device for this job so far.  For printing, the
1494              impressions completed includes interpreting, marking, and
1495              stacking the output.  For other types of job services, the
1496              number of impressions completed includes the number of
1497              impressions processed. Full color impressions are typically
1498              defined as those requiring 3 or more colorants, but this
1499              MAY vary by implementation.  In any case, the value of this
1500              attribute counts by 1 for each side that has full color,
1501              not by the number of colors per side (and the other
1502              impression counters are incremented, except
1503              highlightColorImpressionsCompleted(115)).
1504
```

```
1505          highlightColorImpressionsCompleted(115),
1506                                              Integer32 (-2..2147483647)
1507              INTEGER:  The number of highlight color impressions
1508              completed by the device for this job so far.  For printing,
1509              the impressions completed includes interpreting, marking,
1510              and stacking the output.  For other types of job services,
1511              the number of impressions completed includes the number of
1512              impressions processed.  Highlight color impressions are
1513              typically defined as those requiring black plus one other
1514              colorant, but this MAY vary by implementation.  In any
1515              case, the value of this attribute counts by 1 for each side
1516              that has highlight color (and the other impression counters
1517              are incremented, except
1518              fullColorImpressionsCompleted(114)).
1519
1520          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1521          + Page attributes
1522          +
1523          + See the definition of 'impression', 'sheet', and 'page'
1524          + in Section 2.
1525          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1526
1527          pagesRequested(130),                Integer32 (-2..2147483647)
1528              INTEGER:  The number of logical pages requested by the job
1529              to be processed.
1530
1531          pagesCompleted(131),                Integer32 (-2..2147483647)
1532              INTEGER:  The number of logical pages completed for this
1533              job so far.
1534
1535              For implementations where multiple copies are produced by
1536              the interpreter with only a single pass over the data, the
1537              final value SHALL be equal to the value of the
1538              pagesRequested object.  For implementations where multiple
1539              copies are produced by the interpreter by processing the
1540              data for each copy, the final value SHALL be a multiple of
1541              the value of the pagesRequested object.
1542
1543              NOTE - See the impressionsCompletedCurrentCopy and
1544              pagesCompletedCurrentCopy attributes for attributes that
1545              are reset on each document copy.
1546
1547              NOTE - The pagesCompleted object can be used with the
1548              pagesRequested object to provide an indication of the
1549              relative progress of the job, provided that the
1550              multiplicative factor is taken into account for some
1551              implementations of multiple copies.
1552
```

```
1553          pagesCompletedCurrentCopy(132),   Integer32 (-2..2147483647)
1554              INTEGER:  The number of logical pages completed for the
1555              current copy of the document so far.  This value SHALL be
1556              reset to 0 for each document in the job and for each
1557              document copy.
1558
1559          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1560          + Sheet attributes
1561          +
1562          + See the definition of 'impression', 'sheet', and 'page'
1563          + in Section 2.
1564          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1565
1566          sheetsRequested(150),             Integer32 (-2..2147483647)
1567              INTEGER:  The total number of medium sheets requested to be
1568              produced for this job.
1569
1570              Unlike the jmJobKOctetsPerCopyRequested and
1571              jmJobImpressionsPerCopyRequested attributes, the
1572              sheetsRequested(150) attribute SHALL include the
1573              multiplicative factor contributed by the number of copies
1574              and so is the total number of sheets to be produced by the
1575              job, as opposed to the size of the document(s) submitted.
1576
1577          sheetsCompleted(151),             Integer32 (-2..2147483647)
1578              INTEGER:  The total number of medium sheets that have
1579              completed marking and stacking for the entire job so far
1580              whether those sheets have been processed on one side or on
1581              both.
1582
1583          sheetsCompletedCurrentCopy(152),  Integer32 (-2..2147483647)
1584              INTEGER:  The number of medium sheets that have completed
1585              marking and stacking for the current copy of a document in
1586              the job so far whether those sheets have been processed on
1587              one side or on both.
1588
1589              The value of this attribute SHALL be 0 before the job
1590              starts processing and SHALL be reset to 1 after the first
1591              sheet of each document and document copy in the job is
1592              processed and stacked.
1593

1605              INTEGER:  MULTI-ROW:  The type
1606              AND/OR
1607              OCTETS:  MULTI-ROW:  the name of the medium that is
1608              required by the job.
1609
1610              NOTE - The name (JmJobStringTC) values correspond to the
1611              name values of the prtInputMediaName object in the Printer
1612              MIB [print-mib] and the name, size, and input tray values
1613              of the IPP 'media' attribute [ipp-model].
1614
1615          mediumConsumed(171),               Integer32 (-2..2147483647)
1616                                             AND
1617                                             JmJobStringTC (SIZE(0..63))
1618              INTEGER:  MULTI-ROW:  The number of sheets
1619              AND
1620              OCTETS:  MULTI-ROW:  the name of the medium that has been
1621              consumed so far whether those sheets have been processed on
1622              one side or on both.
1623
1624              This attribute SHALL have both Integer32 and OCTET STRING
1625              (represented as  JmJobStringTC) values.
1626
1627              NOTE - The name (JmJobStringTC) values correspond to the
1628              name values of the prtInputMediaName object in the Printer
1629              MIB [print-mib] and the name, size, and input tray values
1630              of the IPP 'media' attribute [ipp-model].
1631
1632          colorantRequested(172),            Integer32 (-2..2147483647)
1633                                             AND/OR
1634                                             JmJobStringTC (SIZE(0..63))
1635              INTEGER:  MULTI-ROW:  The index (prtMarkerColorantIndex) in
1636              the Printer MIB[print-mib]
1637              AND/OR
1638              OCTETS:  MULTI-ROW:  the name of the colorant requested.
1639
1640              NOTE - The name (JmJobStringTC) values correspond to the
1641              name values of the prtMarkerColorantValue object in the
1642              Printer MIB.  Examples are: red, blue.
```

colorantConsumed(173), Integer32 (-2..2147483647)
AND/OR
JmJobStringTC (SIZE(0..63))

INTEGER: MULTI-ROW: The index (prtMarkerColorantIndex) in the Printer MIB[print-mib]
AND/OR
OCTETS: MULTI-ROW: the name of the colorant consumed.

NOTE - The name (JmJobStringTC) values correspond to the name values of the prtMarkerColorantValue object in the Printer MIB. Examples are: red, blue

mediumTypeConsumed(174), Integer32 (-2..2147483647)
AND
JmJobStringTC (SIZE(0..63))

INTEGER: MULTI-ROW: The number of sheets of the indicated medium type that has been consumed so far whether those sheets have been processed on one side or on both
AND
OCTETS: MULTI-ROW: the name of that medium type.

This attribute SHALL have both Integer32 and OCTET STRING (represented as JmJobStringTC) values.

NOTE - The type name (JmJobStringTC) values correspond to the type name values of the prtInputMediaType object in the Printer MIB [print-mib]. Values are: 'stationery', 'transparency', 'envelope', etc. These medium type names correspond to the enum values of JmMediumTypeTC used in the mediumRequested attribute.

mediumSizeConsumed(175), Integer32 (-2..2147483647)
AND
JmJobStringTC (SIZE(0..63))

INTEGER: MULTI-ROW: The number of sheets of the indicated medium size that has been consumed so far whether those sheets have been processed on one side or on both
AND
OCTETS: MULTI-ROW: the name of that medium size.

This attribute SHALL have both Integer32 and OCTET STRING (represented as JmJobStringTC) values.

NOTE - The size name (JmJobStringTC) values correspond to the size name values in the Printer MIB [print-mib] Appendix B. These size name values are also a subset of the keyword values defined by [ipp-model] for the 'media' Job Template attribute. Values are: 'letter', 'a', 'iso-a4', 'jis-b4', etc.

```
1694          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1695          + Time attributes (set by server or device)
1696          +
1697          + This section of attributes are ones that are set by the
1698          + server or device that accepts jobs.  Two forms of time are
1699          + provided.  Each form is represented in a separate attribute.
1700          + See section 3.1.2 and section 3.1.3 for the
1701          + conformance requirements for time attribute for agents and
1702          + monitoring applications, respectively.  The two forms are:
1703          +
1704          + 'DateAndTime' is an 8 or 11 octet binary encoded year,
1705          + month, day, hour, minute, second, deci-second with
1706          + optional offset from UTC.  See SNMPv2-TC [SMIv2-TC].
1707          +
1708          + NOTE: 'DateAndTime' is not printable characters; it is
1709          + binary.
1710          +
1711          + 'JmTimeStampTC' is the time of day measured in the number of
1712          + seconds since the system was booted.
1713          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1714
1715          jobSubmissionToServerTime(190),   JmTimeStampTC
1716                                            AND/OR
1717                                            DateAndTime
1718              INTEGER:  Configuration 3 only:  The time
1719              AND/OR
1720              OCTETS:  the date and time that the job was submitted to
1721              the server (as distinguished from the device which uses
1722              jobSubmissionTime).
1723
1724          jobSubmissionTime(191),           JmTimeStampTC
1725                                            AND/OR
1726                                            DateAndTime
1727              INTEGER:  Configurations 1, 2, and 3:  The time
1728              AND/OR
1729              OCTETS:  the date and time that the job was submitted to
1730              the server or device to which the agent is providing
1731              access.
1732
1733          jobStartedBeingHeldTime(192),     JmTimeStampTC
1734                                            AND/OR
1735                                            DateAndTime
1736              INTEGER:  The time
1737              AND/OR
1738              OCTETS:  the date and time that the job last entered the
1739              pendingHeld state.  If the job has never entered the
1740              pendingHeld state, then the value SHALL be '0' or the
1741              attribute SHALL not be present in the table.
```

```
1742
1743          jobStartedProcessingTime(193),    JmTimeStampTC
1744                                            AND/OR
1745                                            DateAndTime
1746              INTEGER:  The time
1747              AND/OR
1748              OCTETS:  the date and time that the job started processing.
1749
1750          jobCompletionTime(194),           JmTimeStampTC
1751                                            AND/OR
1752                                            DateAndTime
1753              INTEGER:  The time
1754              AND/OR
1755              OCTETS:  the date and time that the job entered the
1756              completed, canceled, or aborted state.
1757
1758          jobProcessingCPUTime(195)         Integer32 (-2..2147483647)
1759              UNITS     'seconds'
1760              INTEGER:  The amount of CPU time in seconds that the job
1761              has been in the processing state.  If the job enters the
1762              processingStopped state, that elapsed time SHALL not be
1763              included.  In other words, the jobProcessingCPUTime value
1764              SHOULD be relatively repeatable when the same job is
1765              processed again on the same device.
```

3.4 Monitoring Job Progress

There are a number of objects and attributes for monitoring the progress of a job. These objects and attributes count the number of K octets, impressions, sheets, and pages requested or completed. For impressions and sheets, "completed" means stacked, unless the implementation is unable to detect when each sheet is stacked, in which case stacked is approximated when processing of each sheet completes. There are objects and attributes for the overall job and for the current copy of the document currently being stacked. For the latter, the rate at which the various objects and attributes count depends on the sheet and document collation of the job.

Job Collation included sheet collation and document collation. Sheet collation is defined to be the ordering of sheets within a document copy. Document collation is defined to be ordering of document copies within a multi-document job. There are three types of job collation (see terminology definitions in Section 2):

1. uncollatedSheets(3) - No collation of the sheets within each document copy, i.e., each sheet of a document that is to produce multiple copies is replicated before the next sheet in the document is processed and stacked. If the device has an output bin collator, the uncollatedSheets(3) value may actually produce collated sheets as far as the user is concerned (in the output bins). However, when the job collation is the 'uncollatedSheets(3)' value, job progress is indistinguishable to a monitoring application between a device that has an output bin collator and one that does not.

2. collatedDocuments(4) - Collation of the sheets within each document copy is performed within the printing device by making multiple passes over either the source or an intermediate representation of the document. In addition, when there are multiple documents per job, the i'th copy of each document is stacked before the j'th copy of each document, i.e., the documents are collated within each job copy. For example, if a job is submitted with documents, A and B, the job is made available to the end user as: A, B, A, B, …. The 'collatedDocuments(4)' value corresponds to the IPP [ipp-model] 'separate-documents-collated-copies' value of the "multiple-document-handling" attribute.

   If jobCopiesRequested or documentCopiesRequested = 1, then jobCollationType is defined as 4.

3. uncollatedDocuments(5) - Collation of the sheets within each document copy is performed within the printing device by making multiple passes over either the source or an intermediate representation of the document. In addition, when there are

multiple documents per job, all copies of the first document in the job are stacked before the any copied of the next document in the job, i.e., the documents are uncollated within the job. For example, if a job is submitted with documents, A and B, the job is mad available to the end user as: A, A, …, B, B, …. The 'uncollatedDocuments(5)' value corresponds to the IPP [ipp-model] 'separate-documents-uncollated-copies' value of the "multiple-document-handling" attribute.

Consider the following four variables that are used to monitor the progress of a job's impressions:

1. jmJobImpressionsCompleted - counts the total number of impressions stacked for the job

2. impressionsCompletedCurrentCopy - counts the number of impressions stacked for the current document copy

3. sheetCompletedCopyNumber - identifies the number of the copy for the current document being stacked where the first copy is 1.

4. sheetCompletedDocumentNumber - identifies the current document within the job that is being stacked where the first document in a job is 1. NOTE: this attribute SHOULD NOT be implemented for implementations that only support one document per job.

For each of the three types of job collation, a job with three copies of two documents (1, 2), where each document consists of 3 impressions, the four variables have the following values as each sheet is stacked for one-sided printing:

Job Collation Type = uncollatedSheets(3)

jmJobImpressionsCompleted	ImpressionsCompletedCurrentCopy	sheetCompletedCopyNumber	sheetCompletedDocumentNumber
0	0	0	0
1	1	1	1
2	1	2	1
3	1	3	1

18	3	3	2

3.5 Job Identification

There are a number of attributes that permit a user, operator or system administrator to identify jobs of interest, such as jobURI, jobName, jobOriginatingHost, etc. In addition, there is a jmJobSubmissionID object that is a text string table index. Being a table index allows a monitoring application to quickly locate and identify a particular job of interest that was submitted from a particular client by the user invoking the monitoring application without having to scan the entire job table. The Job Monitoring MIB needs to provide for identification of the job at both sides of the job submission process. The primary identification point is the client side. The jmJobSubmissionID allows the monitoring application to identify the job of interest from all the jobs currently "known" by the server or device. The value of jmJobSubmissionID can be assigned by either the client’s local system or a downstream server or device. The point of assignment depends on the job submission protocol in use.

The server/device-side identifier, called the jmJobIndex object, SHALL be assigned by the SNMP Job Monitoring MIB agent when the server or device accepts the jobs from submitting clients. The jmJobIndex object allows the interested party to obtain all objects desired that relate to a particular job. See Section 3.2, entitled ’The Job Tables and the

Oldest Active and Newest Active Indexes' for the specification of how the agent SHALL assign the jmJobIndex values.

The MIB provides a mapping table that maps each jmJobSubmissionID value to a corresponding jmJobIndex value generated by the agent, so that an application can determine the correct value for the jmJobIndex value for the job of interest in a single Get operation, given the Job Submission ID. See the jmJobIDGroup.

In some configurations there may be more than one application program that monitors the same job when the job passes from one network entity to another when it is submitted. See configuration 3. When there are multiple job submission IDs, each entity MAY supply an appropriate jmJobSubmissionID value. In this case there would be a separate entry in the jmJobSubmissionID table, one for each jmJobSubmissionID. All entries would map to the same jmJobIndex that contains the job data. When the job is deleted, it is up to the agent to remove all entries that point to the job from the jmJobSubmissionID table as well.

The jobName attribute provides a name that the user supplies as a job attribute with the job. The jobName attribute is not necessarily unique, even for one user, let alone across users.

3.6 Internationalization Considerations

This section describes the internationalization considerations included in this MIB.

3.6.1 Text generated by the server or device

There are a few objects and attributes generated by the server or device that SHALL be represented using the Universal Multiple-Octet Coded Character Set (UCS) [ISO-10646]. These objects and attributes are always supplied (if implemented) by the agent, not by the job submitting client:

1. jmGeneralJobSetName object
2. processingMessage(6) attribute
3. physicalDevice(32) (name value) attribute

The character encoding scheme for representing these objects and attributes SHALL be UTF-8 as recommended by RFC 2130 [RFC 2130] and the "IETF Policy on Character Sets and Language" [char-set policy]. The 'JmUTF8StringTC' textual convention is used to indicate UTF-8 text strings.

NOTE - For strings in 7-bit US-ASCII, there is no impact since the UTF-8 representation of 7-bit ASCII is identical to the US-ASCII [US-ASCII] encoding.

The text contained in the processingMessage(6) attribute is generated by the server/device. The natural language for the

processingMessage(6) attribute is identified by the processingMessageNaturalLangTag(7) attribute. The processingMessageNaturalLangTag(7) attribute uses the JmNaturalLanguageTagTC textual convention which SHALL conform to the language tag mechanism specified in RFC 1766 [RFC-1766]. The JmNaturalLanguageTagTC value is the same as the IPP [IPP-model] 'naturalLanguage' attribute syntax. RFC 1766 specifies that a US-ASCII string consisting of the natural language followed by an optional country field. Both fields use the same two-character codes from ISO 639 [ISO-639] and ISO 3166 [ISO-3166], respectively, that are used in the Printer MIB for identifying language and country.

Examples of the values of the processingMessageNaturalLangTag(7) attribute include:

1. 'en' for English
2. 'en-us' for US English
3. 'fr' for French
4. 'de' for German

3.6.2 Text supplied by the job submitter

All of the objects and attributes represented by the 'JmJobStringTC' textual-convention are either (1) supplied in the job submission protocol by the client that submits the job to the server or device or (2) are defaulted by the server or device if the job submitting client does not supply values. The agent SHALL represent these objects and attributes in the MIB either (1) in the coded character set as they were submitted or (2) MAY convert the coded character set to another coded character set or encoding scheme. In any case, the resulting coded character set representation SHOULD be UTF-8 [UTF-8], but SHALL be one in which the code positions from 0 to 31 is not used, 32 to 127 is US-ASCII [US-ASCII], 127 is not unused, and the remaining code positions 128 to 255 represent single-byte or multi-byte graphic characters structured according to ISO 2022 [ISO 2022] or are unused.

The coded character set SHALL be one of the ones registered with IANA [IANA] and SHALL be identified by the jobCodedCharSet attribute in the jmJobAttributeTable for the job. If the agent does not know what coded character set was used by the job submitting client, the agent SHALL either (1) return the 'unknown(2)' value for the jobCodedCharSet attribute or (2) not return the jobCodedCharSet attribute for the job.

Examples of coded character sets which meet this criteria for use as the value of the jobCodedCharSet job attribute are: US-ASCII [US-ASCII], ISO 8859-1 (Latin-1) [ISO 8859-1], any ISO 8859-n, HP Roman8, IBM Code Page 850, Windows Default 8-bit set, UTF-8 [UTF-8], US-ASCII plus JIS X0208-1990 Japanese [JIS X0208], US-ASCII plus GB2312-1980 PRC Chinese [GB2312]. See the IANA registry of coded character sets [IANA charsets].

Examples of coded character sets which do not meet this criteria are: national 7-bit sets conforming to ISO 646 (except US-ASCII), EBCDIC, and ISO 10646 (Unicode) [ISO-10646]. In order to represent Unicode characters, the UTF-8 [UTF-8] encoding scheme SHALL be used which has been assigned the MIBenum value of '106' by IANA.

The jobCodedCharSet attribute uses the imported 'CodedCharSet' textual-convention from the Printer MIB [printmib].

The natural language for attributes represented by the textual-convention JmJobStringTC is identified either (1) by the jobNaturalLanguageTag(9) attribute or is keywords in US-English (as in IPP). A monitoring application SHOULD attempt to localize keywords into the language of the user by means of some lookup mechanism. If the keyword value is not known to the monitoring application, the monitoring application SHOULD assume that the value is in the natural language specified by the job's jobNaturalLanguageTag(9) attribute and SHOULD present the value to its user as is. The jobNaturalLanguageTag(9) attribute value SHALL have the same syntax and semantics as the processingMessageNaturalLangTag(7) attribute, except that the jobNaturalLanguageTag(9) attribute identifies the natural language of attributes supplied by the job submitter instead of the natural language of the processingMessage(6) attribute. See Section 3.6.1.

3.6.3 'DateAndTime' for representing the date and time

This MIB also contains objects that are represented using the DateAndTime textual convention from SMIv2 [SMIv2-TC]. The job management application SHALL display such objects in the locale of the user running the monitoring application.

3.7 IANA and PWG Registration Considerations

This MIB does not require any additional registration schemes for IANA, but does depend on registration schemes that other Internet standards track specifications have set up. The names of these IANA registration assignments under the /in-notes/iana/assignments/ path:

1. printer-language-numbers - used as enums in the documentFormat(38) attribute
2. media-types - uses as keywords in the documentFormat(38) attribute
3. character-sets - used as enums in the jobCodedCharSet(8) attribute

The Printer Working Group (PWG) will handle registration of additional enums after approving this standard, according to the procedures described in this section:

3.7.1 PWG Registration of enums

This specification uses textual conventions to define enumerated values (enums) and bit values. Enumerations (enums) and bit values are sets of symbolic values defined for use with one or more objects or attributes. All enumeration sets and bit value sets are assigned a symbolic data type name (textual convention). As a convention the symbolic name ends in "TC" for textual convention. These enumerations are defined at the beginning of the MIB module specification.

The PWG has defined several type of enumerations for use in the Job Monitoring MIB and the Printer MIB[print-mib]. These types differ in the method employed to control the addition of new enumerations. Throughout this document, references to "type n enum", where n can be 1, 2 or 3 can be found in the various tables. The definitions of these types of enumerations are:

3.7.1.1 Type 1 enumerations

Type 1 enumeration: All the values are defined in the Job Monitoring MIB specification (RFC for the Job Monitoring MIB). Additional enumerated values require a new RFC.

There are no type 1 enums in the current draft.

3.7.1.2 Type 2 enumerations

Type 2 enumeration: An initial set of values are defined in the Job Monitoring MIB specification. Additional enumerated values are registered with the PWG.

The following type 2 enums are contained in the current draft :

1. JmUTF8StringTC
2. JmJobStringTC
3. JmNaturalLanguageTagTC
4. JmTimeStampTC
5. JmFinishingTC [same enum values as IPP "finishing" attribute]
6. JmPrintQualityTC [same enum values as IPP "print-quality" attribute]
7. JmTonerEconomyTC
8. JmMediumTypeTC
9. JmJobSubmissionIDTypeTC
10. JmJobCollationTypeTC
11. JmJobStateTC [same enum values as IPP "job-state" attribute]
12. JmAttributeTypeTC

For those textual conventions that have the same enum values as the indicated IPP Job attribute are simultaneously registered by the PWG for use with IPP [ipp-model] and the Job Monitoring MIB.

3.7.1.3 Type 3 enumeration

Type 3 enumeration: An initial set of values are defined in the Job Monitoring MIB specification. Additional enumerated values are registered through the PWG without PWG review.

There are no type 3 enums in the current draft.

3.7.2 PWG Registration of type 2 bit values

This draft contains the following type 2 bit value textual-conventions:

1. JmJobServiceTypesTC
2. JmJobStateReasons1TC
3. JmJobStateReasons2TC
4. JmJobStateReasons3TC
5. JmJobStateReasons4TC

These textual-conventions are defined as bits in an Integer so that they can be used with SNMPv1 SMI. The jobStateReasons*N* (*N*=1..4) attributes are defined as bit values using the corresponding JmJobStateReasons*N*TC textual-conventions.

The registration of JmJobServiceTypesTC and JmJobStateReasons*N*TC bit values follow the procedures for a type 2 enum as specified in Section 3.7.1.2.

3.7.3 PWG Registration of Job Submission Id Formats

In addition to enums and bit values, this specification assigns a single ASCII digit or letter to various job submission ID formats. See the JmJobSubmissionIDTypeTC textual-convention and the object. The registration of JobSubmissionID format numbers follows the procedures for a type 2 enum as specified in Section 3.7.1.2.

3.7.4 PWG Registration of MIME types/sub-types for document-formats

The documentFormat(38) attribute has MIME type/sub-type values for indicating document formats which IANA registers as "media type" names. The values of the documentFormat(38) attribute are the same as the corresponding Internet Printing Protocol (IPP) "document-format" Job attribute values [ipp-model].

3.8 Security Considerations

3.8.1 Read-Write objects

All objects are read-only, greatly simplifying the security considerations. If another MIB augments this MIB, that MIB might accept SNMP Write operations to objects in that MIB whose effect is to modify the values of read-only objects in this MIB. However, that MIB SHALL have to support the required access control in order to achieve security, not this MIB.

3.8.2 Read-Only Objects In Other User's Jobs

The security policy of some sites MAY be that unprivileged users can only get the objects from jobs that they submitted, plus a few minimal objects from other jobs, such as the jmJobKOctetsPerCopyRequested and jmJobKOctetsProcessed objects, so that a user can tell how busy a printer is. Other sites MAY allow all unprivileged users to see all objects of all jobs. This MIB does not require, nor does it specify how, such restrictions would be implemented. A monitoring application SHOULD enforce the site security policy with respect to returning information to an unprivileged end user that is using the monitoring application to monitor jobs that do not belong to that user, i.e., the jmJobOwner object in the jmJobTable does not match the user's user name.

An operator is a privileged user that would be able to see all objects of all jobs, independent of the policy for unprivileged users.

3.9 Notifications

This MIB does not specify any notifications. For simplicity, management applications are expected to poll for status. The jmGeneralJobPersistence and jmGeneralAttributePersistence objects assist an application to determine the polling rate. The resulting network traffic is not expected to be significant.

4 MIB specification

The following pages constitute the actual Job Monitoring MIB.

```
2094  Job-Monitoring-MIB DEFINITIONS ::= BEGIN
2095

2184
2185   JmTimeStampTC ::= TEXTUAL-CONVENTION
```

```
2186      STATUS      current
2187      DESCRIPTION
2188          "The simple time at which an event took place.  The units are
2189          in seconds since the system was booted.
2190
2191          NOTE - JmTimeStampTC is defined in units of seconds, rather
2192          than 100ths of seconds, so as to be simpler for agents to
2193          implement (even if they have to implement the 100ths of a
2194          second to comply with implementing sysUpTime in MIB-II[mib-
2195          II].)
2196
2197          NOTE - JmTimeStampTC is defined as an Integer32 so that it can
2198          be used as a value of an attribute, i.e., as a value of the
2199          jmAttributeValueAsInteger object.  The TimeStamp textual-
2200          convention defined in SNMPv2-TC [SMIv2-TC] is defined as an
2201          APPLICATION 3 IMPLICIT INTEGER tag, not an Integer32 which is
2202          defined in SNMPv2-SMI [SMIv2-TC] as UNIVERSAL 2 IMPLICIT
2203          INTEGER, so cannot be used in this MIB as one of the values of
2204          jmAttributeValueAsInteger."

2221
2222  JmFinishingTC ::= TEXTUAL-CONVENTION
2223      STATUS      current
2224      DESCRIPTION
2225          "The type of finishing operation.
2226
2227          These values are the same as the enum values of the IPP
2228          'finishings' attribute.  See Section 3.7.1.2.
2229
2230          other(1),
2231              Some other finishing operation besides one of the specified
2232              or registered values.
2233
2234          unknown(2),
2235              The finishing is unknown.
2236
2237          none(3),
2238              Perform no finishing.
2239
2240          staple(4),
2241              Bind the document(s) with one or more staples. The exact
2242              number and placement of the staples is site-defined.
2243
2244          punch(5),
2245              This value indicates that holes are required in the
2246              finished document. The exact number and placement of the
2247              holes is site-defined  The punch specification MAY be
2248              satisfied (in a site- and implementation-specific manner)
2249              either by drilling/punching, or by substituting pre-drilled
2250              media.
2251
2252          cover(6),
2253              This value is specified when it is desired to select a non-
2254              printed (or pre-printed) cover for the document. This does
2255              not supplant the specification of a printed cover (on cover
2256              stock medium) by the document itself.
2257
2258          bind(7)
2259              This value indicates that a binding is to be applied to the
2260              document; the type and placement of the binding is product-
2261              specific.
2262
2263          This is a type 2 enumeration.  See Section 3.7.1.2."
2264      SYNTAX      INTEGER {

2281           quality' attribute.  See Section 3.7.1.2.
2282
2283           This is a type 2 enumeration.  See Section 3.7.1.2."
2284       SYNTAX      INTEGER {
                        other(1),     -- Not one of the specified or registered
                                      -- values.
                        unknown(2),   -- The actual value is unknown.
                        draft(3),     -- Lowest quality available on the printer.
                        normal(4),    -- Normal or intermediate quality on the
                                      -- printer.
                        high(5)       -- Highest quality available on the printer.
2285       }
2286
2287
2288
2289
2290   JmPrinterResolutionTC ::= TEXTUAL-CONVENTION
2291       STATUS      current
2292       DESCRIPTION
2293           "Printer resolutions.
2294
2295           Nine octets consisting of two 4-octet SIGNED-INTEGERs followed
2296           by a SIGNED-BYTE.  The values are the same as those specified
2297           in the Printer MIB [printmib]. The first SIGNED-INTEGER
2298           contains the value of prtMarkerAddressabilityXFeedDir.  The
2299           second SIGNED-INTEGER contains the value of
2300           prtMarkerAddressabilityFeedDir.  The SIGNED-BYTE contains the
2301           value of prtMarkerAddressabilityUnit.
2302
2303           Note: the latter value is either 3 (tenThousandsOfInches) or 4
2304           (micrometers) and the addressability is in 10,000 units of
2305           measure. Thus the SIGNED-INTEGERs represent integral values in
2306           either dots-per-inch or dots-per-centimeter.
2307
2308           The syntax is the same as the IPP 'printer-resolution'
2309           attribute.  See Section 3.7.1.2."

        uncollatedSheets(3),    -- sheets within each document copy
                                -- are not collated: 1 1 ..., 2 2 ...,
                                -- No corresponding value of IPP
                                -- "multiple-document-handling"
        collatedDocuments(4),   -- internal collated sheets,
                                -- documents: A, B, A, B, ...
                                -- Corresponds to IPP "multiple-
                                -- document-handling"='separate-
                                -- documents-collated-copies'
        uncollatedDocuments(5)  -- internal collated sheets,
                                -- documents: A, A, ..., B, B, ...
                                -- Corresponds to IPP "multiple-
                                -- document-handling"='separate-
                                -- documents-uncollated-copies'
    }

JmJobSubmissionIDTypeTC ::= TEXTUAL-CONVENTION
    STATUS      current
    DESCRIPTION
        "Identifies the format type of a job submission ID.

        Each job submission ID is a fixed-length, 48-octet printable
        US-ASCII [US-ASCII] coded character string containing no
        control characters, consisting of the following fields:

          octet  1:  The format letter identifying the format.  The US-
            ASCII characters '0-9', 'A-Z', and 'a-z' are assigned in
            order giving 62 possible formats.
          octets 2-40:  A 39-character, US-ASCII trailing SPACE filled
            field specified by the format letter, if the data is less
            than 39 ASCII characters.
          octets 41-48:  A sequential or random US-ASCII number to make
            the ID quasi-unique.

        If the client does not supply a job submission ID in the job
        submission protocol, then the agent SHALL assign a job
        submission ID using any of the standard formats that are
        reserved for the agent.  Clients SHALL not use formats that are
        reserved for agents and agents SHALL NOT use formats that are
```

reserved for clients, in order to reduce conflicts in ID generation. See the description for which formats are reserved for clients or for agents.

Registration of additional formats may be done following the procedures described in Section 3.7.3.

The format values defined at the time of completion of this specification are:

Format
Letter Description
------ ------------
'0' Job Owner generated by the server/device
octets 2-40: The last 39 bytes of the jmJobOwner object.
octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the agent.
This format is reserved for agents.

NOTE - Clients wishing to use a job submission ID that incorporates the job owner, SHALL use format '8', not format '0'.

'1' Job Name
octets 2-40: The last 39 bytes of the jobName attribute.
octets 41-48: The US-ASCII 8-decimal-digit random number assigned by the client.
This format is reserved for clients.

'2' Client MAC address
octets 2-40: The client MAC address: in hexadecimal with each nibble of the 6 octet address being '0'-'9' or 'A' - 'F' (uppercase only). Most significant octet first.
octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the client.
This format is reserved for clients.

'3' Client URL
octets 2-40: The last 39 bytes of the client URL [URI-spec].
octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the client.
This format is reserved for clients.

'4' Job URI
octets 2-40: The last 39 bytes of the URI [URI-spec] assigned by the server or device to the job when the job was submitted for processing.
octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the agent.
This format is reserved for agents.

'5' POSIX User Number

2512 octets 2-40: The last 39 bytes of a user number, such as POSIX
2513 user number.
2514 octets 41-48: The US-ASCII 8-decimal-digit sequential number
2515 assigned by the client.
2516 This format is reserved for clients.
2517
2518 '6' User Account Number
2519 octets 2-40: The last 39 bytes of the user account number.
2520 octets 41-48: The US-ASCII 8-decimal-digit sequential number
2521 assigned by the client.
2522 This format is reserved for clients.
2523
2524 '7' DTMF Incoming FAX routing number
2525 octets 2-40: The last 39 bytes of the DTMF incoming FAX
2526 routing number.
2527 octets 41-48: The US-ASCII 8-decimal-digit sequential number
2528 assigned by the client.
2529 This format is reserved for clients.
2530
2531 '8' Job Owner supplied by the client
2532 octets 2-40: The last 39 bytes of the job owner name (that the
2533 agent returns in the jmJobOwner object).
2534 octets 41-48: The US-ASCII 8-decimal-digit sequential number
2535 assigned by the client.
2536 This format is reserved for clients. See format '0' which is
2537 reserved for agents.
2538
2539 '9' Host Name
2540 octets 2-40: The last 39 bytes of the host name with trailing
2541 SPACES that submitted the job to this server/device using a
2542 protocol, such as LPD [RFC-1179] which includes the host
2543 name in the job submission protocol.
2544 octets 41-48: The US-ASCII 8-decimal-digit leading zero
2545 representation of the job id generated by the submitting
2546 server (configuration 3) or the client (configuration 1 and
2547 2), such as in the LPD protocol.
2548 This format is reserved for clients.
2549
2550 'A' AppleTalk Protocol
2551 octets 2-40: Contains the AppleTalk printer name, with the
2552 first character of the name in octet 2. AppleTalk printer
2553 names are a maximum of 31 characters. Any unused portion
2554 of this field shall be filled with spaces.
2555 octets 41-48: '00000XXX', where 'XXX' is the 3-digit US-ASCII
2556 decimal representation of the Connection Id.
2557 This format is reserved for agents.
2558

'B' NetWare PServer
octets 2-40: Contains the Directory Path Name as recorded by the Novell File Server in the queue directory. If the string is less than 40 octets, the left-most character in the string shall appear in octet position 2. Otherwise, only the last 39 bytes shall be included. Any unused portion of this field shall be filled with spaces.
octets 41-48: '000XXXXX' The US-ASCII representation of the Job Number as per the NetWare File Server Queue Management Services.
This format is reserved for agents.

'C' Server Message Block protocol (SMB)
octets 2-40: Contains a decimal (US-ASCII coded) representation of the 16 bit SMB Tree Id field, which uniquely identifies the connection that submitted the job to the printer. The most significant digit of the numeric string shall be placed in octet position 2. All unused portions of this field shall be filled with spaces. The SMB Tree Id has a maximum value of 65,535.
octets 41-48: The US-ASCII 8-decimal-digit leading zero representation of the File Handle returned from the device to the client in response to a Create Print File command.
This format is reserved for agents.

'D' Transport Independent Printer/System Interface (TIP/SI)
octets 2-40: Contains the Job Name from the Job Control-Start Job (JC-SJ) command. If the Job Name portion is less than 40 octets, the left-most character in the string shall appear in octet position 2. Any unused portion of this field shall be filled with spaces. Otherwise, only the last 39 bytes shall be included.
octets 41-48: The US-ASCII 8-decimal-digit leading zero representation of the jmJobIndex assigned by the agent.
This format is reserved for agents, since the agent supplies octets 41-48, though the client supplies the job name. See format '1' reserved to clients to submit job name ids in which they supply octets 41-48.

'E' IPDS on the MVS or VSE platform

octets 2-40: Contains bytes 2-27 of the XOH Define Group Boundary Group ID triplet. Octet position 2 MUST carry the value x'01'. Bytes 28-40 MUST be filled with spaces.
octets 41-48: The US-ASCII 8-decimal-digit leading zero representation of the jmJobIndex assigned by the agent.
This format is reserved for agents, since the agent supplies octets 41-48, though the client supplies the job name.

```
2608          'F' IPDS on the VM platform
2609          octets 2-40:  Contains bytes 2-31 of the XOH Define Group
2610              Boundary Group ID triplet. Octet position 2 MUST carry the
2611              value x'02'.  Bytes 32-40 MUST be filled with spaces.
2612          octets 41-48: The US-ASCII 8-decimal-digit leading zero
2613              representation of the jmJobIndex assigned by the agent.
2614          This format is reserved for agents, since the agent supplies
2615              octets 41-48, though the client supplies the file name.
2616
2617          'G' IPDS on the OS/400 platform
2618          octets 2-40:  Contains bytes 2-36 of the XOH Define Group
2619              Boundary Group ID triplet.  Octet position 2 MUST carry the
2620              value x'03'.  Bytes 37-40 MUST be filled with spaces.
2621          octets 41-48: The US-ASCII 8-decimal-digit leading zero
2622              representation of the jmJobIndex assigned by the agent.
2623          This format is reserved for agents, since the agent supplies
2624              octets 41-48, though the client supplies the job name.
2625
2626          NOTE - the job submission id is only intended to be unique
2627          between a limited set of clients for a limited duration of
2628          time, namely, for the life time of the job in the context of
2629          the server or device that is processing the job.  Some of the
2630          formats include something that is unique per client and a
2631          random number so that the same job submitted by the same client
2632          will have a different job submission id.  For other formats,
2633          where part of the id is guaranteed to be unique for each
2634          client, such as the MAC address or URL, a sequential number
2635          SHOULD suffice for each client (and may be easier for each
2636          client to manage).  Therefore, the length of the job submission
2637          id has been selected to reduce the probability of collision to
2638          an extremely low number, but is not intended to be an absolute
2639          guarantee of uniqueness.  None-the-less, collisions are
2640          remotely possible, but without bad consequences, since this MIB
2641          is intended to be used only for monitoring jobs, not for
2642          controlling and managing them.
2643
2644          This is like a type 2 enumeration.  See section 3.7.3."
2645      SYNTAX    OCTET STRING(SIZE(1)) -- ASCII '0'-'9', 'A'-'Z', 'a'-'z'
```

```
JmJobStateTC ::= TEXTUAL-CONVENTION
    STATUS      current
    DESCRIPTION
        "The current state of the job (pending, processing, completed,
        etc.).

        The following figure shows the normal job state transitions:

                                                          +----> canceled(7)
                                                         /
    +---> pending(3) -------> processing(5) ------+------> completed(9)
    |         ^                    ^              \
--->+         |                    |               +----> aborted(8)
    |         v                    v              /
    +---> pendingHeld(4)  processingStopped(6) ---+
```

Figure 4 - Normal Job State Transitions

Normally a job progresses from left to right. Other state transitions are unlikely, but are not forbidden. Not shown are the transitions to the canceled state from the pending, pendingHeld, and processingStopped states.

Jobs in the pending, processing, and processingStopped states are called 'active', while jobs in the pendingHeld, canceled, aborted, and completed states are called 'inactive'. Jobs reach one of the three terminal states: completed, canceled, or aborted, *after* the jobs have completed all activity, and all MIB objects and attributes have reached their final values for the job.

These values are the same as the enum values of the IPP 'job-state' job attribute. See Section 3.7.1.2.

unknown(2),
    The job state is *not* known, or its state is indeterminate.

pending(3),
    The job is a candidate to start processing, but is not yet processing.

pendingHeld(4),
    The job is not a candidate for processing for any number of reasons but will return to the pending state as soon as the reasons are no longer present. The job's jmJobStateReasons1 object and/or jobStateReasons*N* (*N*=2..4) attributes SHALL indicate why the job is no longer a candidate for processing. The reasons are represented as bits in the jmJobStateReasons1 object and/or jobStateReasons*N* (*N*=2..4) attributes. See the

JmJobStateReasons*N*TC (*N*=1..4) textual convention for the specification of each reason.

processing(5),
One or more of:

1. the job is using, or is attempting to use, one or more purely software processes that are analyzing, creating, or interpreting a PDL, etc.,

2. the job is using, or is attempting to use, one or more hardware devices that are interpreting a PDL, making marks on a medium, and/or performing finishing, such as stapling, etc.,

OR

3. (configuration 2) the server has made the job ready for printing, but the output device is not yet printing it, either because the job hasn't reached the output device or because the job is queued in the output device or some other spooler, awaiting the output device to print it.

When the job is in the processing state, the entire job state includes the detailed status represented in the device MIB indicated by the hrDeviceIndex value of the job's physicalDevice attribute, if the agent implements such a device MIB.

Implementations MAY, though they NEED NOT, include additional values in the job's jmJobStateReasons1 object to indicate the progress of the job, such as adding the jobPrinting value to indicate when the device is actually making marks on a medium and/or the processingToStopPoint value to indicate that the server or device is in the process of canceling or aborting the job.

processingStopped(6),
The job has stopped while processing for any number of reasons and will return to the processing state as soon as the reasons are no longer present.

The job's jmJobStateReasons1 object and/or the job's jobStateReasons*N* (*N*=2..4) attributes MAY indicate why the job has stopped processing. For example, if the output device is stopped, the deviceStopped value MAY be included in the job's jmJobStateReasons1 object.

NOTE - When an output device is stopped, the device usually indicates its condition in human readable form at the device. The management application can obtain more complete device status remotely by querying the appropriate

```
2749            device MIB using the job's deviceIndex attribute(s), if the
2750            agent implements such a device MIB
2751
2752        canceled(7),
2753            A client has canceled the job and the server or device has
2754            completed canceling the job AND all MIB objects and
2755            attributes have reached their final values for the job.
2756            While the server or device is canceling the job, the job's
2757            jmJobStateReasons1 object SHOULD contain the
2758            processingToStopPoint value and one of the canceledByUser,
2759            canceledByOperator, or canceledAtDevice values.  The
2760            canceledByUser, canceledByOperator, or canceledAtDevice
2761            values remain while the job is in the canceled state.
2762
2763        aborted(8),
2764            The job has been aborted by the system, usually while the
2765            job was in the processing or processingStopped state and
2766            the server or device has completed aborting the job AND all
2767            MIB objects and attributes have reached their final values
2768            for the job.  While the server or device is aborting the
2769            job, the job's jmJobStateReasons1 object MAY contain the
2770            processingToStopPoint and abortedBySystem values.  If
2771            implemented, the abortedBySystem value SHALL remain while
2772            the job is in the aborted state.
2773
2774        completed(9)
2775            The job has completed successfully or with warnings or
2776            errors after processing and all of the media have been
2777            successfully stacked in the appropriate output bin(s) AND
2778            all MIB objects and attributes have reached their final
2779            values for the job.  The job's jmJobStateReasons1 object
2780            SHOULD contain one of: completedSuccessfully,
2781            completedWithWarnings, or completedWithErrors values.
2782
2783        This is a type 2 enumeration.  See Section 3.7.1.2."
2784      SYNTAX      INTEGER {

2795   JmAttributeTypeTC ::= TEXTUAL-CONVENTION
2796       STATUS      current
2797       DESCRIPTION
2798           "The type of the attribute which identifies the attribute.
2799
2800           NOTE - The enum assignments are grouped logically with values
2801           assigned in groups of 20, so that additional values may be
2802           registered in the future and assigned a value that is part of
2803           their logical grouping.
2804
2805           Values in the range 2**30 to 2**31-1 are reserved for private
2806           or experimental usage.  This range corresponds to the same
2807           range reserved in IPP.  Implementers are warned that use of
2808           such values may conflict with other implementations.
2809           Implementers are encouraged to request registration of enum
2810           values following the procedures in Section 3.7.1.
2811
2812           See Section 3.2 entitled 'The Attribute Mechanism' for a
2813           description of this textual-convention and its use in the
2814           jmAttributeTable.  See Section 3.3.8 for the specification of
2815           each attribute.  The comment(s) after each enum assignment
2816           specifies the data type(s) of the attribute.
2817
2818           This is a type 2 enumeration.  See Section 3.7.1.2."

```
JmJobServiceTypesTC ::= TEXTUAL-CONVENTION
    STATUS      current
    DESCRIPTION
        "Specifies the type(s) of service to which the job has been
        submitted (print, fax, scan, etc.).  The service type is
        represented as an enum that is bit encoded with each job
        service type so that more general and arbitrary services can be
        created, such as services with more than one destination type,
        or ones with only a source or only a destination.  For example,
        a job service might scan, faxOut, and print a single job.  In
        this case, three bits would be set in the jobServiceTypes
        attribute, corresponding to the hexadecimal values: 0x8 + 0x20
        + 0x4, respectively, yielding: 0x2C.

        Whether this attribute is set from a job attribute supplied by
        the job submission client or is set by the recipient job
        submission server or device depends on the job submission
        protocol.  With either implementation, the agent SHALL return a
        non-zero value for this attribute indicating the type of the
        job.

        One of the purposes of this attribute is to permit a requester
        to filter out jobs that are not of interest.  For example, a
        printer operator MAY only be interested in jobs that include
        printing.  That is why the attribute is in the job
        identification category.

        The following service component types are defined (in
        hexadecimal) and are assigned a separate bit value for use with
        the jobServiceTypes attribute:

        other                                0x1
            The job contains some instructions that are not one of the
            identified types.

        unknown                              0x2
            The job contains some instructions whose type is unknown to
            the agent.

        print                                0x4
            The job contains some instructions that specify printing

        scan                                 0x8
            The job contains some instructions that specify scanning

        faxIn                                0x10
            The job contains some instructions that specify receive fax

        faxOut                               0x20
            The job contains some instructions that specify sending fax
```

```
3003            getFile                             0x40
3004                The job contains some instructions that specify accessing
3005                files or documents
3006
3007            putFile                             0x80
3008                The job contains some instructions that specify storing
3009                files or documents
3010
3011            mailList                            0x100
3012                The job contains some instructions that specify
3013                distribution of documents using an electronic mail system.
3014
3015            These bit definitions are the equivalent of a type 2 enum
3016            except that combinations of them MAY be used together.  See
3017            section 3.7.1.2."
3018        SYNTAX      INTEGER (0..2147483647)   -- 31 bits, all but sign bit
3019
3020
3021
3022    JmJobStateReasons1TC ::= TEXTUAL-CONVENTION
3023        STATUS      current
3024        DESCRIPTION
3025            "The JmJobStateReasonsNTC (N=1..4) textual-conventions are used
3026            with the jmJobStateReasons1 object and jobStateReasonsN
3027            (N=2..4), respectively, to provide additional information
3028            regarding the current jmJobState object value.  These values
3029            MAY be used with any job state or states for which the reason
3030            makes sense.
3031
3032            NOTE - While values cannot be added to the jmJobState object
3033            without impacting deployed clients that take actions upon
3034            receiving jmJobState values, it is the intent that additional
3035            JmJobStateReasonsNTC enums can be defined and registered
3036            without impacting such deployed clients.  In other words, the
3037            jmJobStateReasons1 object and jobStateReasonsN attributes are
3038            intended to be extensible.
3039
3040            NOTE - The Job Monitoring MIB contains a superset of the IPP
3041            values[ipp-model] for the IPP 'job-state-reasons' attribute,
3042            since the Job Monitoring MIB is intended to cover other job
3043            submission protocols as well.  Also some of the names of the
3044            reasons have been changed from 'printer' to 'device', since the
3045            Job Monitoring MIB is intended to cover additional types of
3046            devices, including input devices, such as scanners.
3047
3048            The following standard values are defined (in hexadecimal) as
3049            powers of two, since multiple values MAY be used at the same
3050            time.  For ease of understanding, the JmJobStateReasons1TC
3051            reasons are presented in the order in which the reasons are
3052            likely to occur (if implemented), starting with the
3053            'jobIncoming' value and ending with the
3054            'jobCompletedWithErrors' value.
```

3055
3056 other 0x1
3057 The job state reason is not one of the standardized or
3058 registered reasons.
3059
3060 unknown 0x2
3061 The job state reason is not known to the agent or is
3062 indeterminent.
3063
3064 jobIncoming 0x4
3065 The job has been accepted by the server or device, but the
3066 server or device is expecting (1) additional operations
3067 from the client to finish creating the job and/or (2) is
3068 accessing/accepting document data.
3069
3070 submissionInterrupted 0x8
3071 The job was not completely submitted for some unforeseen
3072 reason, such as: (1) the server has crashed before the job
3073 was closed by the client, (2) the server or the document
3074 transfer method has crashed in some non-recoverable way
3075 before the document data was entirely transferred to the
3076 server, (3) the client crashed or failed to close the job
3077 before the time-out period.
3078
3079 jobOutgoing 0x10
3080 Configuration 2 only: The server is transmitting the job
3081 to the device.
3082
3083 jobHoldSpecified 0x20
3084 The value of the job’s jobHold(52) attribute is TRUE. The
3085 job SHALL NOT be a candidate for processing until this
3086 reason is removed and there are no other reasons to hold
3087 the job.
3088
3089 jobHoldUntilSpecified 0x40
3090 The value of the job’s jobHoldUntil(53) attribute specifies
3091 a time period that is still in the future. The job SHALL
3092 NOT be a candidate for processing until this reason is
3093 removed and there are no other reasons to hold the job.
3094
3095 jobProcessAfterSpecified 0x80
3096 The value of the job’s jobProcessAfterDateAndTime(51)
3097 attribute specifies a time that is still in the future.
3098 The job SHALL NOT be a candidate for processing until this
3099 reason is removed and there are no other reasons to hold
3100 the job.
3101

resourcesAreNotReady 0x100
At least one of the resources needed by the job, such as media, fonts, resource objects, etc., is not ready on any of the physical devices for which the job is a candidate. This condition MAY be detected when the job is accepted, or subsequently while the job is pending or processing, depending on implementation.

deviceStoppedPartly 0x200
One or more, but not all, of the devices to which the job is assigned are stopped. If all of the devices are stopped (or the only device is stopped), the deviceStopped reason SHALL be used.

deviceStopped 0x400
The device(s) to which the job is assigned is (are all) stopped.

jobInterpreting 0x800
The device to which the job is assigned is interpreting the document data.

jobPrinting 0x1000
The output device to which the job is assigned is marking media. This value is useful for servers and output devices which spend a great deal of time processing (1) when no marking is happening and then want to show that marking is now happening or (2) when the job is in the process of being canceled or aborted while the job remains in the processing state, but the marking has not yet stopped so that impression or sheet counts are still increasing for the job.

jobCanceledByUser 0x2000
The job was canceled by the owner of the job, i.e., by a user whose name is the same as the value of the job's jmJobOwner object, or by some other authorized end-user, such as a member of the job owner's security group.

jobCanceledByOperator 0x4000
The job was canceled by the operator, i.e., by a user who has been authenticated as having operator privileges (whether local or remote).

jobCanceledAtDevice 0x8000
The job was canceled by an unidentified local user, i.e., a user at a console at the device.

abortedBySystem 0x10000
The job (1) is in the process of being aborted, (2) has been aborted by the system and placed in the 'aborted' state, or (3) has been aborted by the system and placed in the 'pendingHeld' state, so that a user or operator can manually try the job again.

processingToStopPoint 0x20000
The requester has issued an operation to cancel or interrupt the job or the server/device has aborted the job, but the server/device is still performing some actions on the job until a specified stop point occurs or job termination/cleanup is completed.

This reason is recommended to be used in conjunction with the processing job state to indicate that the server/device is still performing some actions on the job while the job remains in the processing state. After all the job's resources consumed counters have stopped incrementing, the server/device moves the job from the processing state to the canceled or aborted job states.

serviceOffLine 0x40000
The service or document transform is off-line and accepting no jobs. All pending jobs are put into the pendingHeld state. This situation could be true if the service's or document transform's input is impaired or broken.

jobCompletedSuccessfully 0x80000
The job completed successfully.

jobCompletedWithWarnings 0x100000
The job completed with warnings.

jobCompletedWithErrors 0x200000
The job completed with errors (and possibly warnings too).

The following additional job state reasons have been added to represent job states that are in ISO DPA[iso-dpa] and other job submission protocols:

jobPaused 0x400000
The job has been indefinitely suspended by a client issuing an operation to suspend the job so that other jobs may proceed using the same devices. The client MAY issue an operation to resume the paused job at any time, in which case the agent SHALL remove the jobPaused values from the job's jmJobStateReasons1 object and the job is eventually resumed at or near the point where the job was paused.

```
3201            jobInterrupted                      0x800000
3202                The job has been interrupted while processing by a client
3203                issuing an operation that specifies another job to be run
3204                instead of the current job.  The server or device will
3205                automatically resume the interrupted job when the
3206                interrupting job completes.
3207
3208            jobRetained                         0x1000000
3209                The job is being retained by the server or device with all
3210                of the job's document data (and submitted resources, such
3211                as fonts, logos, and forms, if any).  Thus a client could
3212                issue an operation to the server or device to either (1)
3213                re-do the job (or a copy of the job) on the same server or
3214                device or (2) resubmit the job to another server or device.
3215                When a client could no longer re-do/resubmit the job, such
3216                as after the document data has been discarded, the agent
3217                SHALL remove the jobRetained value from the
3218                jmJobStateReasons1 object.
3219
3220            These bit definitions are the equivalent of a type 2 enum
3221            except that combinations of bits may be used together.  See
3222            section 3.7.1.2.  The remaining bits are reserved for future
3223            standardization and/or registration."
3224        SYNTAX      INTEGER (0..2147483647)   -- 31 bits, all but sign bit
3225
3226
3227
3228    JmJobStateReasons2TC ::= TEXTUAL-CONVENTION
3229        STATUS      current
3230        DESCRIPTION
3231            "This textual-convention is used with the jobStateReasons2
3232            attribute to provides additional information regarding the
3233            jmJobState object.  See the description under
3234            JmJobStateReasons1TC for additional information that applies to
3235            all reasons.
3236
3237            The following standard values are defined (in hexadecimal) as
3238            powers of two, since multiple values may be used at the same
3239            time:
3240
3241            cascaded                            0x1
3242                An outbound gateway has transmitted all of the job's job
3243                and document attributes and data to another spooling
3244                system.
3245
3246            deletedByAdministrator              0x2
3247                The administrator has deleted the job.
3248
3249            discardTimeArrived                  0x4
3250                The job has been deleted due to the fact that the time
3251                specified by the job's job-discard-time attribute has
3252                arrived.
```

3253
3254 postProcessingFailed 0x8
3255 The post-processing agent failed while trying to log
3256 accounting attributes for the job; therefore the job has
3257 been placed into the completed state with the jobRetained
3258 jmJobStateReasons1 object value for a system-defined period
3259 of time, so the administrator can examine it, resubmit it,
3260 etc.
3261
3262 jobTransforming 0x10
3263 The server/device is interpreting document data and
3264 producing another electronic representation.
3265
3266 maxJobFaultCountExceeded 0x20
3267 The job has faulted several times and has exceeded the
3268 administratively defined fault count limit.
3269
3270 devicesNeedAttentionTimeOut 0x40
3271 One or more document transforms that the job is using needs
3272 human intervention in order for the job to make progress,
3273 but the human intervention did not occur within the site-
3274 settable time-out value.
3275
3276 needsKeyOperatorTimeOut 0x80
3277 One or more devices or document transforms that the job is
3278 using need a specially trained operator (who may need a key
3279 to unlock the device and gain access) in order for the job
3280 to make progress, but the key operator intervention did not
3281 occur within the site-settable time-out value.
3282
3283 jobStartWaitTimeOut 0x100
3284 The server/device has stopped the job at the beginning of
3285 processing to await human action, such as installing a
3286 special cartridge or special non-standard media, but the
3287 job was not resumed within the site-settable time-out value
3288 and the server/device has transitioned the job to the
3289 pendingHeld state.
3290
3291 jobEndWaitTimeOut 0x200
3292 The server/device has stopped the job at the end of
3293 processing to await human action, such as removing a
3294 special cartridge or restoring standard media, but the job
3295 was not resumed within the site-settable time-out value and
3296 the server/device has transitioned the job to the completed
3297 state.
3298
3299 jobPasswordWaitTimeOut 0x400
3300 The server/device has stopped the job at the beginning of
3301 processing to await input of the job’s password, but the
3302 password was not received within the site-settable time-out
3303 value.
3304

deviceTimedOut 0x800
A device that the job was using has not responded in a period specified by the device's site-settable attribute.

connectingToDeviceTimeOut 0x1000
The server is attempting to connect to one or more devices which may be dial-up, polled, or queued, and so may be busy with traffic from other systems, but server was unable to connect to the device within the site-settable time-out value.

transferring 0x2000
The job is being transferred to a down stream server or downstream device.

queuedInDevice 0x4000
The server/device has queued the job in a down stream server or downstream device.

jobQueued 0x8000
The server/device has queued the document data.

jobCleanup 0x10000
The server/device is performing cleanup activity as part of ending normal processing.

jobPasswordWait 0x20000
The server/device has selected the job to be next to process, but instead of assigning resources and starting the job processing, the server/device has transitioned the job to the pendingHeld state to await entry of a password (and dispatched another job, if there is one).

validating 0x40000
The server/device is validating the job *after* accepting the job.

queueHeld 0x80000
The operator has held the entire job set or queue.

jobProofWait 0x100000
The job has produced a single proof copy and is in the pendingHeld state waiting for the requester to issue an operation to release the job to print normally, obeying any job and document copy attributes that were originally submitted.

heldForDiagnostics 0x200000
The system is running intrusive diagnostics, so that all jobs are being held.

```
3355          noSpaceOnServer                    0x800000
3356              There is no room on the server to store all of the job.
3357
3358          pinRequired                        0x1000000
3359              The System Administrator settable device policy is (1) to
3360              require PINs, and (2) to hold jobs that do not have a pin
3361              supplied as an input parameter when the job was created.
3362
3363          exceededAccountLimit               0x2000000
3364              The account for which this job is drawn has exceeded its
3365              limit.  This condition SHOULD be detected before the job is
3366              scheduled so that the user does not wait until his/her job
3367              is scheduled only to find that the account is overdrawn.
3368              This condition MAY also occur while the job is processing
3369              either as processing begins or part way through processing.
3370
3371          heldForRetry                       0x4000000
3372              The job encountered some errors that the server/device
3373              could not recover from with its normal retry procedures,
3374              but the error might not be encountered if the job is
3375              processed again in the future.  Example cases are phone
3376              number busy or remote file system in-accessible.  For such
3377              a situation, the server/device SHALL transition the job
3378              from the processing to the pendingHeld, rather than to the
3379              aborted state.
3380
3381          The following values are from the X/Open PSIS draft standard:
3382
3383          canceledByShutdown                 0x8000000
3384              The job was canceled because the server or device was
3385              shutdown before completing the job.
3386
3387          deviceUnavailable                  0x10000000
3388              This job was aborted by the system because the device is
3389              currently unable to accept jobs.
3390
3391          wrongDevice                        0x20000000
3392              This job was aborted by the system because the device is
3393              unable to handle this particular job; the spooler SHOULD
3394              try another device or the user should submit the job to
3395              another device.
3396
3397          badJob                             0x40000000
3398              This job was aborted by the system because this job has a
3399              major problem, such as an ill-formed PDL; the spooler
3400              SHOULD not even try another device.
3401
3402          These bit definitions are the equivalent of a type 2 enum

jmGeneralJobSetName OBJECT-TYPE
    SYNTAX      JmUTF8StringTC (SIZE(0..63))
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        "The human readable name of this job set assigned by the system
        administrator (by means outside of this MIB).  Typically, this
        name SHOULD be the name of the job queue.  If a server or
        device has only a single job set, this object can be the
        administratively assigned name of the server or device itself.
        This name does not need to be unique, though each job set in a
        single Job Monitoring MIB SHOULD have distinct names.

        NOTE - If the job set corresponds to a single printer and the
        Printer MIB is implemented, this value SHOULD be the same as
        the prtGeneralPrinterName object in the draft Printer MIB
        [print-mib-draft].  If the job set corresponds to an IPP
        Printer, this value SHOULD be the same as the IPP 'printer-
        name' Printer attribute.

        NOTE - The purpose of this object is to help the user of the
        job monitoring application distinguish between several job sets
        in implementations that support more than one job set.

        See the OBJECT compliance macro for the minimum maximum length
        required for conformance."

3711      MAX-ACCESS  not-accessible
3712      STATUS      current
3713      DESCRIPTION
3714          "A quasi-unique 48-octet fixed-length string ID which
3715          identifies the job within a particular client-server
3716          environment.  There are multiple formats for the
3717          jmJobSubmissionID.  Each format SHALL be uniquely identified.
3718          See the JmJobSubmissionIDTypeTC textual convention.  Each
3719          format SHALL be registered using the procedures of a type 2
3720          enum.  See section 3.7.3 entitled: 'PWG Registration of Job
3721          Submission Id Formats'.
3722
3723          If the requester (client or server) does not supply a job
3724          submission ID in the job submission protocol, then the
3725          recipient (server or device) SHALL assign a job submission ID
3726          using any of the standard formats that have been reserved for
3727          agents and adding the final 8 octets to distinguish the ID from
3728          others submitted from the same requester.
3729
3730          The monitoring application, whether in the client or running
3731          separately, MAY use the job submission ID to help identify
3732          which jmJobIndex was assigned by the agent, i.e., in which row
3733          the job information is in the other tables.
3734
3735          NOTE - fixed-length is used so that a management application
3736          can use a shortened GetNext varbind (in SNMPv1 and SNMPv2) in
3737          order to get the next submission ID, disregarding the remainder
3738          of the ID in order to access jobs independent of the trailing
3739          identifier part, e.g., to get all jobs submitted by a
3740          particular jmJobOwner or submitted from a particular MAC
3741          address.
3742
3743          See the JmJobSubmissionIDTypeTC textual convention.

jmJobKOctetsPerCopyRequested OBJECT-TYPE
    SYNTAX      Integer32 (-2..2147483647)
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        "The total size in K (1024) octets of the document(s) being
        requested to be processed in the job.  The agent SHALL round
        the actual number of octets up to the next highest K.  Thus 0
        octets is represented as '0', 1-1024 octets is represented as
        '1', 1025-2048 is represented as '2', etc.

        In computing this value, the server/device SHALL NOT include
        the multiplicative factors contributed by (1) the number of
        document copies, and (2) the number of job copies, independent
        of whether the device can process multiple copies of the job or
        document without making multiple passes over the job or
        document data and independent of whether the output is collated
        or not.  Thus the server/device computation is independent of
        the implementation and indicates the size of the document(s)
        measured in K octets independent of the number of copies."
    DEFVAL      { -2 }      -- the default is unknown(-2)
    ::= { jmJobEntry 5 }

jmJobKOctetsProcessed OBJECT-TYPE
    SYNTAX      Integer32 (-2..2147483647)
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        "The total number of octets processed by the server or device
        measured in units of K (1024) octets so far.  The agent SHALL
        round the actual number of octets processed up to the next
        higher K.  Thus 0 octets is represented as '0', 1-1024 octets
        is represented as '1', 1025-2048 octets is '2', etc.  For
        printing devices, this value is the number interpreted by the
        page description language interpreter rather than what has been
        marked on media.

        For implementations where multiple copies are produced by the
        interpreter with only a single pass over the data, the final
        value SHALL be equal to the value of the
        jmJobKOctetsPerCopyRequested object.  For implementations where
        multiple copies are produced by the interpreter by processing
        the data for each copy, the final value SHALL be a multiple of
        the value of the jmJobKOctetsPerCopyRequested object.

        NOTE - See the impressionsCompletedCurrentCopy and
        pagesCompletedCurrentCopy attributes for attributes that are
        reset on each document copy.
```

```
3971            NOTE - The jmJobKOctetsProcessed object can be used with the
3972            jmJobKOctetsPerCopyRequested object to provide an indication of
3973            the relative progress of the job, provided that the
3974            multiplicative factor is taken into account for some
3975            implementations of multiple copies."
3976        DEFVAL      { 0 }      -- default is no octets processed.

4090      DESCRIPTION
4091          "Attributes representing information about the job and
4092          document(s) or resources required and/or consumed.
4093
4094          Each entry in the jmAttributeTable is a per-job entry with an
4095          extra index for each type of attribute (jmAttributeTypeIndex)
4096          that a job can have and an additional index
4097          (jmAttributeInstanceIndex) for those attributes that can have
4098          multiple instances per job.  The jmAttributeTypeIndex object
4099          SHALL contain an enum type that indicates the type of attribute
4100          (see the JmAttributeTypeTC textual-convention).  The value of
4101          the attribute SHALL be represented in either the
4102          jmAttributeValueAsInteger or jmAttributeValueAsOctets objects,
4103          and/or both, as specified in the JmAttributeTypeTC textual-
4104          convention.
4105
```

```
4106          The agent SHALL create rows in the jmAttributeTable as the
4107          server or device is able to discover the attributes either from
4108          the job submission protocol itself or from the document PDL.
4109          As the documents are interpreted, the interpreter MAY discover
4110          additional attributes and so the agent adds additional rows to
4111          this table.  As the attributes that represent resources are
4112          actually consumed, the usage counter contained in the
4113          jmAttributeValueAsInteger object is incremented according to
4114          the units indicated in the description of the JmAttributeTypeTC
4115          enum.
4116
4117          The agent SHALL maintain each row in the jmAttributeTable for
4118          at least the minimum time after a job completes as specified by
4119          the jmGeneralAttributePersistence object.
4120
4121          Zero or more entries SHALL exist in this table for each job in
4122          a job set.
4123
4124          See Section 3.3 entitled 'The Attribute Mechanism' for a
4125          description of the jmAttributeTable."

4183
```

```
4184  jmAttributeValueAsInteger OBJECT-TYPE
4185      SYNTAX      Integer32 (-2..2147483647)
4186      MAX-ACCESS  read-only
4187      STATUS      current
4188      DESCRIPTION
4189          "The integer value of the attribute.  The value of the
4190          attribute SHALL be represented as an integer if the enum
4191          description in the JmAttributeTypeTC textual-convention
4192          definition has the tag: 'INTEGER:'.
4193
4194          Depending on the enum definition, this object value MAY be an
4195          integer, a counter, an index, or an enum, depending on the
4196          jmAttributeTypeIndex value.  The units of this value are
4197          specified in the enum description.
4198
4199          For those attributes that are accumulating job consumption as
4200          the job is processed as specified in the JmAttributeTypeTC
4201          textual-convention, SHALL contain the final value after the job
4202          completes processing, i.e., this value SHALL indicate the total
4203          usage of this resource made by the job.
4204
4205          A monitoring application is able to copy this value to a
4206          suitable longer term storage for later processing as part of an
4207          accounting system.
4208
4209          Since the agent MAY add attributes representing resources to
4210          this table while the job is waiting to be processed or being
4211          processed, which can be a long time before any of the resources
4212          are actually used, the agent SHALL set the value of the
4213          jmAttributeValueAsInteger object to 0 for resources that the
4214          job has not yet consumed.
4215
4216          Attributes for which the concept of an integer value is
4217          meaningless, such as fileName(34), jobName, and
4218          processingMessage, do not have the 'INTEGER:' tag in the
4219          JmAttributeTypeTC definition and so an agent SHALL always
4220          return a value of '-1' to indicate 'other' for the value of the
4221          jmAttributeValueAsInteger object for these attributes.
4222
4223          For attributes which do have the 'INTEGER:' tag in the
4224          JmAttributeTypeTC definition, if the integer value is not (yet)
4225          known, the agent either (1) SHALL not materialize the row in
4226          the jmAttributeTable until the value is known or (2) SHALL
4227          return a '-2' to represent an 'unknown' counting integer value,
4228          a '0' to represent an 'unknown' index value, and a '2' to
4229          represent an 'unknown(2)' enum value."
4230      DEFVAL      { -2 }      -- default value is unknown(-2)
4231      ::= { jmAttributeEntry 3 }
4232
```

5 Appendix A - Implementing the Job Life Cycle

The job object has well-defined states and client operations that affect the transition between the job states. Internal server and device actions also affect the transitions of the job between the job states. These states and transitions are referred to as the job's *life cycle*.

Not all implementations of job submission protocols have all of the states of the job model specified here. The job model specified here is intended to be a superset of most implementations. It is the purpose of the agent to map the particular implementation's job life cycle onto the one specified here. The agent MAY omit any states not implemented. Only the processing and completed states are required to be implemented by an agent. However, a conforming management application SHALL be prepared to accept any of the states in the job life cycle specified here, so that the management application can interoperate with any conforming agent.

The job states are intended to be user visible. The agent SHALL make these states visible in the MIB, but only for the subset of job states that the implementation has. Some implementations MAY need to have sub-states of these user-visible states. The jmJobStateReasons1 object and the jobStateReasons*N* (*N*=2..4) attributes can be used to represent the sub-states of the jobs.

Job states are intended to last a user-visible length of time in most implementations. However, some jobs may pass through some states in zero time in some situations and/or in some implementations.

The job model does not specify how accounting and auditing is implemented, except to assume that accounting and auditing logs are separate from the job life cycle and last longer than job entries in the MIB. Jobs in the completed, aborted, or canceled states are not logs, since jobs in these states are accessible via SNMP protocol operations and SHALL be removed from the Job Monitoring MIB tables after a site-settable or implementation-defined period of time. An accounting application MAY copy accounting information incrementally to an accounting log as a job processes, or MAY be copied while the job is in the canceled, aborted, or completed states, depending on implementation. The same is true for auditing logs.

The jmJobState object specifies the standard job states. The normal job state transitions are shown in the state transition diagram presented in Table 1.

6 APPENDIX B - Support of Job Submission Protocols

A companion PWG document, entitled "Job Submission Protocol Mapping Recommendations for the Job Monitoring MIB" [protomap] contains the recommended usage of each of the objects and attributes in this MIB with a number of job submission protocols. In particular, which job submission ID format should be used is indicated for each job submission protocol.

Some job submission protocols have support for the client to specify a job submission ID. A second approach is to enhance the document format to embed the job submission ID in the document data. This second approach is independent of the job submission protocol. This appendix lists some examples of these approaches.

Some PJL implementations wrap a banner page as a PJL job around a job submitted by a client. If this results in multiple job submission IDs, the agent SHALL create multiple jmJobIDEntry rows in the jmJobIDTable that each point to the same job entry in the job tables. See the specification of the jmJobIDEntry.

9 Change History

This section summarizes the changes in each version after version 1.0 in reverse chronological order.

9.1 Changes to produce version 1.1, dated October 1, 1998

The following changes were made to version 1.0, dated February 3, 1998 to make version 1.1, dated October 1, 1998:

1. Clarified sections 3.3.3 and 3.3.7 so that the DEFVAL of 0 for index attributes is different from the DEFVAL for jmAttributeValueAsInteger which is -2.

2. Clarified the relationships of the values of the JmJobCollationTypeTC with the IPP "multiple-document-handling" attribute.

3. Clarified that the values of the mediumRequested(170) and mediumConsumed(171) attributes may be any of the IPP ’media’ values which are media names, media size names, and input tray names.

4. Added the two attributes approved by the PWG for registration in April 1998: mediumTypeConsumed(174) and mediumSizeConsumed(175).

5. Changed "insure" to "ensure’.

6. Correct an incorrect reference in the jmAttributeEntry DESCRIPTION from jmJobTable to jmAttributeTable.

9.2 Changes to produce version 1.2, dated October 2, 1998

The following changes were made to version 1.1, dated October 1, 1998 to make version 1.2, dated October 2, 1998:

1. Removed all REFERENCE clauses since they referred to sections in the specification that were not in the MIB.

2. Moved the definitions of the attributes from the TC to a new section 3.3.8.

3. Removed the attributes from the Table of Contents

4. Added the data types as ASN.1 comments after each attribute enum.

5. Changed a number of occurrences of "SHALL" to "is" when they were just definitions, rather than conformance requirements.

10 INDEX

This index includes the textual conventions, the objects, and the attributes. Textual conventions all start with the prefix: "JM" and end with the suffix: "TC". Objects all starts with the prefix: "jm" followed by the group name. Attributes are identified with enums, and so start with any lower case letter and have no special prefix.
